

Montana Fish, Wildlife & Parks

DRAFT

Draft Statewide Fisheries Management Plan 2012 - 2018

August 30, 2012

Attention!

FWP encourages readers to provide comments on this Draft Plan. The comment period begins September 10 and ends October 12, 2012.

Please submit comments online at fwp.mt.gov, or email comments to FWPFishPlanComments@mt.gov, or mail to Montana Fish, Wildlife & Parks, Attention: Fish Plan Comments, PO Box 200701, 1420 E. 6th Ave., Helena, MT 59620-0701

MESSAGE FROM THE FWP FISHERIES CHIEF

Dear Interested Reader:

I want to encourage you to take part in the development of Montana's first Statewide Fisheries Management Plan. FWP is proposing a plan that describes the main fisheries programs and the management emphasis and priorities for all waters of the state. The plan will help guide regulation setting, budget and project prioritization, and routine management decision-making. The plan provides enough flexibility to allow for adaptive management during implementation.

This is FWP's first statewide fisheries management plan. FWP relies on the experience of its staff, institutional knowledge, input from the public, laws and rules, and individual waterbody or species plans to form the basis of its fisheries management approach. The new plan documents all of this information and provides the rationale for management decisions and direction. It will serve as a valuable resource to the angling public and FWP staff responsible for managing Montana's fisheries.

Public involvement is critical to the success of this plan. I encourage you to attend one of the public meetings we have scheduled across the state. You can also submit your comments via the FWP website (fwp.mt.gov). A copy of the proposed plan and public meeting information are available on the website.

The FWP Commission is the decision-maker for the Final Plan. The Commission will make its decision after considering input from the public. A final decision is tentatively scheduled for the December 20, 2012 Commission meeting.

Fish and the angling opportunities they provide are incredibly important to the people of Montana and their visitors. Thank you for your interest and participation in the development of this plan!

Bruce Rich
Fisheries Chief
Montana Fish, Wildlife & Parks

FWP STATEWIDE FISHERIES MANAGEMENT PLAN: PART I

Introduction and Purpose of the Plan

Montana is home to a wide variety of fish species that provide quality angling opportunities throughout the state. Montana Fish, Wildlife & Parks (FWP) is the primary custodian of these resources and serves this role by managing the fish and their habitat. FWP does so for the enjoyment of anglers and in the interest of maintaining an assemblage of native and nonnative fish species across the landscape. To accomplish this, FWP is engaged in management decisions and implementation at a statewide, programmatic level and in the field for individual drainages and waterbodies.

Managing Montana's fisheries and the angling opportunities they provide is a complex and often challenging task. FWP must take into account the number and types of fish in a waterbody and how those species interact. There are numerous state and federal laws designed to protect threatened and endangered species, all of which affect management decisions. Not all fish species cohabitate well and it is sometimes necessary to suppress some species in order to conserve others. Fish diseases, aquatic invasive species, and illegal introductions of fish are just a few of the many issues that confront FWP on a regular basis. There are environmental challenges, such as drought and fire. There are landscapes altered from various types of use and development. There are increasing demands on water resources. FWP often must balance conflicting values and angling interests. These responsibilities and challenges occur within a complex socio-economic arena where fish and the angling opportunities they provide are incredibly important to the residents of this state, their visitors, and the many businesses that rely on angling-related tourism dollars.

To help meet these challenges, and in order to provide the public with the rationale behind its management approach and decisions, FWP is developing a statewide fisheries management plan (this document). The plan describes the main fisheries programs, current operations or areas of work within these programs, and the management emphasis and priorities for all waters of the state. The plan will help guide regulation setting, budget and project prioritization, and routine management decision making. The plan provides enough flexibility to allow for adaptive management during implementation.

This is FWP's first statewide fisheries management plan. FWP relies on the experience of its staff, institutional knowledge, input from the public, laws and rules, and individual waterbody or species plans to form the basis of its management approach. The Statewide Fisheries Management Plan documents all of this knowledge in one document, which will serve as a valuable resource to the angling public and the FWP staff responsible for managing Montana's fisheries.

Scope and Organization of Plan

The plan provides management direction for all waters of the state, either specifically or categorically, that are under the jurisdiction of FWP. Notable exceptions include Montana waters in Yellowstone or Glacier National Parks, although FWP coordinates closely with the National

Park Service (NPS) on fisheries management, protection, and restoration in these waters. Similarly, the plan does not apply to Montana waters within the boundaries of Native American Tribal Reservations (unless specifically stated in this plan) but FWP frequently coordinates with the Tribes regarding fisheries management.

There are some large water-bodies in the State that have separate fisheries management plans. Most of these are high use fisheries or native fish conservation programs. The statewide plan does not override those plans but defers to them and provides guidance for managing adjacent waters in a manner that complements and coordinates with those individual plans. Examples are the Fort Peck Reservoir Fisheries Management Plan, the Upper Missouri River (Helena Area) Reservoirs Fisheries Management Plan, and the Flathead Lake Fisheries Co-Management Plan (to be collaboratively developed and administered by FWP and the Confederated Salish and Kootenai Tribes). Similarly, there are numerous waterbody-specific native fish species and/or aquatic habitat restoration strategies (e.g., An Integrated Stream Restoration and Native Fish Conservation Strategy for the Blackfoot River Basin) and interagency agreements (e.g., Memorandum of Understanding and Conservation Agreement for Westslope Cutthroat Trout and Yellowstone Cutthroat Trout). The statewide plan does not supersede current plans but is meant to defer to them as appropriate.

The Statewide Fisheries Management Plan consists of two parts. Part One describes the overarching, statewide goals and objectives for the core Fisheries programs and areas of work within these programs. Part One also describes special management issues, challenges, initiatives, and areas of work within each program and guidance for addressing them.

Part Two provides direction for fisheries management within 40 drainage basins of the state (boundaries derived for fisheries management purposes). For each drainage basin there is a short narrative that describes the fisheries, including fisheries potential, limiting factors, and special issues or challenges facing the drainage, as well as fishing access status and needs. There is also a table for each drainage basin that prescribes a management type (approach) and direction for principal fish species found in the drainage or waterbody.

Introduction to the FWP Fisheries Program

According to its mission statement, Montana Fish, Wildlife & Parks, through its employees and citizen commission, provides for the stewardship of the fish, wildlife, parks, and recreational resources of Montana, while contributing to the quality of life for present and future generations.

In support of this mission, the FWP Fisheries Program (Program) preserves, maintains, and enhances aquatic species and their ecosystems to meet the public's demand for recreational opportunities and stewardship of aquatic wildlife. FWP accomplishes this by: implementing policies and programs that emphasize the management of wild fish populations and the protection and restoration of their habitats; operating an efficient hatchery program to stock lakes and reservoirs where natural reproduction is limited or lacking and when needed, use the hatchery program to fulfill management objectives for conservation programs; monitoring and regulating angler harvests to maintain balanced ecosystems; and by providing educational programs and maintaining adequate public access to fisheries.

The Fish and Wildlife Division of FWP, which includes the Fisheries Bureau, has its state headquarters in Helena, Montana. FWP also has seven geographic administrative regions with a regional headquarters in each region. Implementation of most policy and management activities occurs at the regional level.

The primary function of the Fisheries headquarters is to coordinate state-wide programs, budgeting, planning, and development of rules and policy. Headquarters staff includes a Fisheries Chief, Section Supervisors, Program Coordinators and Specialists, and Administrative Support Staff. They provide overarching direction for the Program's three core administrative sections (primary areas of work): Fisheries Management; Fisheries Habitat; and Fishing Access and Recreation Management. More details are provided in subsequent sections of this plan.

Each region is staffed with a regional supervisor (supervises all Fish and Wildlife Division programs within a region), a regional fisheries manager, and a varying number of fisheries biologists, technicians, and fishing access and recreation management staff. The regional fisheries staff is primarily responsible for implementing and administering the programs, goals and objectives of the Fisheries Program.

FWP Work Units that support Fisheries Program

There are a number of bureaus, work units and programs within FWP that provide support to the Fisheries Program. For example, there are Wildlife Management Areas and State Parks that provide angling opportunities and fisheries habitat. The Legal Unit, for example, provides important guidance and support in the promulgation and interpretation of laws and rules. The Information Technology and Database Services unit provides essential services to fisheries management. The FWP Finance Division plays a key role in supporting Fisheries operations and ensuring fiscal accountability. Two bureaus in particular warrant additional mention due to the critical support they provide to the Fisheries Program: the Communication and Education Bureau's Aquatic Education program, and the Enforcement Bureau.

Communication and Education: Aquatic Education

The Aquatic Education Program was developed to increase the awareness and appreciation of Montana's fisheries and aquatic resources. An important component of the program is the integration of aquatic and fish-related topics into Montana schools, along with promoting fishing among both children and adults.

The need for an education program has often been demonstrated to anglers, FWP staff, and fishing clubs. Through a variety of activities, including classroom educational programs, public fishing clinics, educational fishing license exemptions, and promoting fishing and outdoor recreation to children and adults, the Aquatic Education program seeks to enhance the public understanding of the state's fisheries and water-quality issues and thereby cultivate safe, successful, and ethical behavior among those using these resources.

Law Enforcement

Law enforcement is essential for ensuring compliance with FWP rules, regulations and state laws that protect and enhance the state's fisheries. Direct field contact with anglers and recreational

users is the primary method used to encourage compliance with fishing regulations and other rules. This is accomplished on streams, lakes, and at Fishing Access Sites. In-depth investigations are also used to address more complex problems such as: illegal importation, introduction and transplantation of non-native fish, and illegal fishing outfitting and guiding.

Investigations and monitoring occur as needed to follow up on reports of illegal taking of spawning fish, as well as the taking of fish from sensitive, protected fish populations. Wardens also detect and investigate unlawful commercial sale of game fish and sturgeon/paddlefish caviar. Other efforts include public and youth education, fish pond inspections, patrol and presence at fishing contests, cooperative efforts with Tribal authorities, compliance at boat check stations, assisting with surveys, license compliance, and efforts to support and expand stream and bridge access across the state.

Fisheries Program Funding Sources

The Fisheries Program is allocated a portion of the revenue earned from the sale of State fishing and hunting licenses, commonly referred to as "license revenue." The Program also receives money from the federal government. The biggest portion of this money is derived from the Federal Aid in Sport Fish Restoration Act, commonly called the Dingell-Johnson Act or Wallop-Breaux Act. The Act imposes a ten percent excise tax on the sale of certain items of sport fishing tackle, a three percent excise tax on fish finders and electric trolling motors, import duties on fishing tackle, yachts and pleasure craft, interest on the account, and a portion of motorboat fuel tax revenues and small-engine fuel taxes.

Federal aid funds are collected in an account known as the Sport Fish Restoration Account and allocated to the states for management and restoration of fish having "material value in connection with sport or recreation in the marine and/or fresh waters of the United States." In addition, amendments to the Act provide funds to the states for aquatic education, wetlands restoration, boat safety and clean vessel sanitation devices (pump-outs), and a non-trailerable boat program. The Program also receives federal funds for native species conservation and restoration, and federal and private mitigation funds (mostly from hydroelectric generation).

Other sources of funding include permit fees, e.g., commercial-use permit fees for fishing outfitters and guides, and special use permit fees for some fishing contests. These types of fees are allocated to the FWP fishing access site program.

MONTANA'S FISHERIES RESOURCES

Montana is home to 82 species of fish; 51 native to the state, 31 non-native (introduced), and a number of subspecies and hybrid crosses. Within the seven ecoregions of the state (see map at start of Part II of Plan for ecoregion boundaries), the lower Yellowstone and lower Missouri have the greatest number of total species (66 in lower Missouri, 63 in lower Yellowstone). By contrast, the ecoregions west of the Continental Divide are relatively species poor, with the Kootenai having 28 species, the Clark Fork having 38 species and the much smaller St. Mary River drainage having only 16 species. Statewide, there are almost 54,000 miles of streams and rivers that hold fish, and over 697,000 acres of lakes, ponds and reservoirs with fish. Refer to Table 1 below for a list of Montana fish species and their distribution.

Table 1. List of Montana Fish Species

Family	Species	Scientific Name	Native to Montana? Yes or No	ORIGIN						
				Kootenai River	Clark Fork	St. Mary River	Upper Missouri River	Lower Missouri River	Upper Yellowstone River	Lower Yellowstone River
Catfish	Black Bullhead	<i>Ameiurus melas</i>	No	X	X		X	X	X	X

² Lake trout are native to only three lakes in Montana.

FISHERIES MANAGEMENT PROGRAM

Fisheries Management Goals

1. Provide a diversity of quality angling opportunities through management of self-sustaining wild fisheries and the responsible use of hatchery-reared fish.
2. Protect, maintain, and restore native fish populations, their habitats, life cycles, and genetic diversity to ensure stewardship of native species and to ensure angling opportunities whenever possible.

Background and Description

The central purpose for managing the state's fisheries is to provide a diversity of quality angling opportunities while protecting, maintaining and restoring populations of native and non-native species of fish. Generally speaking, the activities needed to manage the state's fisheries include monitoring the life cycles of different fish populations in varied habitats, manipulating fish populations to meet management goals, operating a hatchery system to stock fish for anglers and for conservation purposes, understanding trends in angling pressure and preferences, and devising strategies to maintain sufficiently healthy and genetically diverse fish populations. The need to devise effective strategies for dealing with the illegal introduction of fish and other aquatic species into the state's waters is also crucial.

Monitoring activities such as netting and electrofishing provide managers with data on the size, composition, and trends of individual fish species, which is necessary to effectively manage the state's fisheries. An analysis of these data may reveal a need to manipulate a population to meet management goals. Fisheries that are maintained by hatchery stocking (typically lakes and reservoirs) can be easily manipulated by changing stocking rates or sizes of fish that are stocked. Manipulation of wild fisheries (most streams and rivers, but also some lakes and reservoirs) is typically more difficult. Engaging anglers for this purpose through fishing regulations is the preferred method, but often may not be sufficient if the target species is not easily captured by hook and line, or if the pressure on the waterbody is insufficient to accomplish the desired changes.

Other methods used to increase the abundance of a managed species may include habitat manipulations to improve spawning or rearing habitat, providing fish passage at barriers that allow a fish to access spawning grounds, or improving water flows or water quality to allow for greater numbers of fish. Often times the management goal may be to reduce or eliminate a certain species if it was illegally introduced, is a competitor with, or predator on, a more desirable or preferred species, or compromises the genetic integrity of the more-preferred species through hybridization. In such cases, liberal fishing regulations may help reduce or suppress the target species, but more aggressive means may be required such as electrofishing, commercial netting, biological control (introducing a predator or parasite), or removing important habitat such as spawning substrate. To eliminate all of the undesirable species in a waterbody is much more difficult, and chemical treatments with fish toxicants (rotenone or antimycin) are often used

for this purpose. Dewatering a waterbody may also work if the fish are in a reservoir that can be drained, or are located in a side-channel that can be shut off from water.

Tradeoffs in fisheries management are sometimes necessary when two or more species exist in a waterbody. The tradeoffs become more difficult when the species assemblage includes both native and non-native species, when the species compete with, prey upon, or genetically hybridize with one another, or when there is a popular sport or commercial fishery involved. An example is managing a predator-prey type fishery that provides angling opportunity for both species, e.g., a fishery with yellow perch and pike or walleye.

It is FWP's goal to maintain viable populations of all native species in Montana. Some native species have high conservation value, including Endangered Species Act (ESA) listed species (e.g., bull trout, pallid sturgeon, Kootenai River white sturgeon) and Species of Concern (SOC) designated species (e.g., sauger, cutthroat trout, paddlefish). The goal is to maintain all populations of these species. Native species *with* sport fishing value, but with no special conservation status (e.g., channel catfish, shovelnose sturgeon, mountain whitefish), are managed much like non-native species with sport-fishing value. This designation means that on a case-by-case basis their populations will be maintained or adjusted upward or downward depending on their popularity and interactions with other species. Native species *without* sport-fishing value (e.g., longnose dace, mottled sculpins, fathead minnows, longnose suckers) are managed as forage fish (as appropriate) but individual populations are not protected as a general rule.

It is sometimes necessary to exclude one fish species in order to maintain a population of another species. This exclusion occurs most often when managing populations of native, resident cutthroat trout, which are often hybridized by rainbow trout or are outcompeted by brook trout (non-native species). In these situations, a refuge is created, often consisting of an artificial barrier or waterfall to prevent invasion by non-native species. In these refugia, non-native species are typically suppressed or eliminated. FWP prefers to develop refugia in locations where there is not already a popular fishery for the native or a non-native sport fish. Typically, where a native species with conservation or sport fish value coexists with a non-native species with sport fish value (such as bull trout and lake trout), and there is potential conflict between the two species (usually non-native species preying on the native species), the management goal is to ensure stable populations of both species while not favoring one over the other.

In situations where popular fisheries exist for two non-native species (such as walleye and rainbow trout), the decision to favor one over the other, or the decision to try to achieve a balance between the two, is based on a number of factors. These include but are not limited to the suitability of the habitat for the competing species, the biological capacity of the affected waterbody, and public sentiment.

Monitoring fish populations and ecological health

FWP collects data on fish abundance, distribution, and trends to establish and maintain an understanding of the overall health and well being of the state's fisheries. Data collection and interpretation form the basis of FWP's understanding of fish resources in the state. These data allow FWP to do the best job possible of managing and protecting the resource for public use and enjoyment, including making management decisions about fishing regulations, making

recommendations to other agencies and individuals, and solving fisheries problems, both biological and social. These data are used to monitor trends in populations and to understand how changes, ranging from human-caused to natural changes, affect populations. Making informed, biologically sound, and ecologically defensible, decisions is only possible through effective and comprehensive data collection and interpretation.

Information on the status and trends of fish populations is used to evaluate the effectiveness of existing fishing regulations or the capacity of a population to respond to alternative regulations. Survey results and inventory work have been essential to the management of the resource and have helped to ascribe and quantify damages to natural resources over the last century, including highway construction, dam operations, and environmental disasters.

Results from survey and inventory activities are used in explaining fisheries and aquatic habitat information and providing technical assistance to the general public, angling groups and school children. Information is disseminated to the public through a variety of sources ranging from peer-reviewed publications in scientific journals to talks with sporting groups at a local level.

Description of current operations and/or areas of work

The *methods* used to sample fish and other components of the aquatic environment are similar in each FWP region but the *techniques* vary depending on the specific site, species sought, or monitoring question. Despite a large number of species present in a water body, biologists will often monitor an indicator fish species, aquatic invertebrates, and selected water quality parameters to detect adverse impacts from contaminants and alterations of habitat. Methods and techniques are constantly being refined and evaluated, and biologists rely on a combination of novel techniques (taking advantage of cost and accurate technologies) and techniques and methods that honor past traditions that make data comparisons possible. FWP provides training to its staff and others to maintain skills and adherence to FWP guidelines.

Special issues, challenges or initiatives

Whereas collecting and monitoring data is critical work and leads to an understanding and management of the considerable resources in this state, it is also a costly endeavor. It is therefore important to be thoughtful, efficient, and effective. FWP routinely analyzes its monitoring efforts for effectiveness and efficiency, and to ensure that goals are being met.

Applicable laws, rules and policies

None identified.

Regulation Setting Process

The FWP Commission has statutory authority (87-1-304, MCA) to fix seasons, bag limits, possession limits and season limits for any species of game fish defined in 87-2-101, MCA. It may also declare a closed season on any fish threatened with undue depletion for any cause. Collectively, these limits and seasons are referred to as “fishing regulations.”

The Commission may set new regulations or modify existing ones at any time deemed necessary. The normal regulation setting process, however, is conducted on a four-year cycle with annual

changes made in special circumstances. Every fourth year FWP seeks ideas from the angling public and fisheries staff about regulation changes they would like to see enacted. FWP then proposes regulation changes to the FWP Commission, which in turn decides which proposals will be advanced for public review. It is the Commission's prerogative to amend FWP's proposals before soliciting public comments. Regulation changes are typically initiated at the August Commission meeting. The Commission makes a final decision based on input from the public and FWP staff. With the exception of emergency or time-sensitive situations, the regulations adopted by the Commission in October go into effect on March 1 of the following year. These changes are captured in the Fishing Regulation booklet for that year, which is normally available at FWP offices and license agents beginning in mid-February.

FWP does not formally solicit ideas from the public during the other three years of the cycle (off-years), although ideas are submitted throughout the four-year cycle. The reason for a four-year cycle with formal public involvement occurring every fourth year is to give new regulations time to work, and to reduce time that staff and the public must devote to the regulation setting process. During these off-years FWP may consider regulation changes generated by FWP fisheries and enforcement staff. There are rigid criteria, however, for the types of regulation changes that can be considered during off-years. Proposals that meet one or more of the following criteria are eligible for presentation to the Commission:

- 1) Clarifications (regulation change is needed to clarify intent of regulation or to correct typos or other errors that led to erroneous information in regulations);
- 2) Enforcement (regulation change is needed to improve enforcement efforts, to prevent illegal take, or to clarify intent to reduce innocent violations);
- 3) Conservation (regulation change is needed to conserve or protect the population of any species, but primarily Threatened and Endangered species);
- 4) Relevancy (regulation no longer has a real management purpose or value and there is little public following, constituency or controversy);
- 5) Management Plans (FWP has committed to implementing certain regulation changes if certain events transpire, e.g., changes in fish populations, angling pressure, catch rates, etc.)

Drought-related Fishing Restrictions

Low water flows and/or high water temperatures on trout-bearing streams can stress fish to the point of mortality. This effect can be exacerbated when fish are caught by anglers. It is during these conditions that FWP may implement the Angling Restrictions and Fishing Closure rule (12.5.501-509, ARM). This rule states that FWP can implement angling restrictions or closures with the approval of the FWP Commissioner in whose district the restriction or closure is proposed. An *angling restriction* prohibits fishing during the period of day when water temperatures are highest, usually between the hours of 2 p.m. and midnight. The criteria for implementing an angling restriction are: 1) daily maximum water temperatures that have reached or exceeded 73° F at any time during three consecutive days (60° F in the case of bull trout waters); or 2) where stream or river flows fall to or below the 95% daily exceedence level based on hydrologic records for that waterbody; or 3) water conditions meet criteria stated in a Drought Management Plan.

A *angling closure* prohibits fishing at all times of day, and the criteria to implement these closures include all of those mentioned above for angling restrictions, plus: 1) dissolved oxygen in the water is less than 4 parts per million (ppm) when measured before sunrise; or 2) other biological or environmental conditions exist that FWP determines have the potential to adversely affect the fishery. A drought-related angling restriction or closure remains in effect until September 15 of that same year, although FWP has the discretion to reopen the stream earlier if stream conditions improve and meet criteria listed in the rule.

Hatchery System

FWP operates eleven fish hatcheries that produce a variety of sport and native fish. The eleven hatcheries are classified as either broodstock or production, with some of the facilities having a vital role in native species restoration efforts. *Broodstock facilities* maintain mature adults that are spawned on station, the eggs are kept on-station and raised for production or go into future broodstock year classes. *Production facilities* typically do not maintain any spawning adults, and are primarily used for producing fish for stocking out as either fry, fingerlings or catchables.

FWP hatcheries maintain captive broodstocks for rainbow trout (Jocko River and Murray Springs), westslope cutthroat trout (Washoe Park), Yellowstone cutthroat trout (Yellowstone River), arctic grayling (Yellowstone River), and large and smallmouth bass (Miles City). Other sources for eggs and fish include wild populations in specific rivers, lakes and reservoirs, and private, state or federal hatcheries within and outside of Montana. Ten of the hatcheries are owned and operated by FWP. The Fort Peck and Murray Springs hatcheries are owned by the US Army Corps of Engineers and operated by FWP.

Description of current operations and/or areas of work

For ponds, lakes and reservoirs, hatchery-produced eggs and fish are used to provide or enhance recreational fisheries. Where there is no natural reproduction, or where there is no recruitment to support a fishery, hatchery fish of appropriate species are stocked to provide a fishery. In waters where natural recruitment is insufficient, hatchery fish are used to augment sportfish populations. Where sportfish populations have been locally extirpated by various causes (e.g., drought, winter or summer kill, or chemical removal) hatchery fish are used to restore sportfish populations. Montana hatcheries are crucial components in the restoration of many of Montana's native fish species. Restoration efforts for Yellowstone and westslope cutthroat trout, redband trout, pallid sturgeon, sauger, and arctic grayling rely on Montana hatcheries for eggs and fish from captive and wild broodstocks.

The Montana hatcheries are also a primary resource for informing and educating the public about fisheries issues. Many hatchery visitors do not participate in hunting and fishing, and their visit to a hatchery is their only contact with FWP. Additionally, a hatchery may be their only experience with fish in an environment where they can interface with, observe, and appreciate fish. Hatchery displays and personnel provide information to visitors about FWP's fish and wildlife management activities and environmental issues. Visitor centers, aquariums, living stream displays and other exhibits educate the public about hatchery history, fish culture, species diversity, limnology, aquatic ecology, and environmental issues. Hatcheries are also important sites for educating school and civic groups.

Overview of the State Fish Hatcheries

Big Springs Trout Hatchery

Located seven miles south of Lewistown, Big Springs is currently the largest FWP salmonid production facility. The hatchery is composed of an upper unit on land leased from the City of Lewistown and a lower unit on FWP land. The current annual production of over 1.8 million fish includes five species: rainbow trout, brown trout, Yellowstone cutthroat trout, grayling, and kokanee salmon.

Bluewater Springs Trout Hatchery

Located on FWP land seven miles east of Bridger, Bluewater Springs Trout Hatchery is an FWP production facility, which produces up to 1.5 million fish annually. Species of fish produced typically include three strains of rainbow trout, Yellowstone cutthroat trout, and grayling.

Flathead Lake Salmon Hatchery

Flathead Lake Salmon Hatchery is located on FWP land on the northwest shore of Flathead Lake, near Somers. The primary activity is the collection and incubation of wild kokanee salmon eggs to meet an annual statewide kokanee requirement of approximately 2 million salmon. It shares the production and distribution of these salmon with other hatcheries. Over 1 million fry are raised and distributed annually. The hatchery is also involved with the incubation and distribution of grayling and westslope cutthroat trout.

Fort Peck Fish Hatchery

The Fort Peck Hatchery is owned by the U.S. Army Corps of Engineers but staffed and operated by FWP. Opened in the spring of 2006, this facility is capable of rearing a wide variety of warm-water and cold-water fish including walleye, northern pike, rainbow trout and Chinook salmon. The facility has 64 rearing tanks and incubation capacity for up to 125 million walleye eggs and 500,000 Chinook salmon eggs. Forty outdoor ponds are used in the spring and summer for raising fingerling warmwater fish, and 8 outdoor concrete raceways are used for rearing fall-released chinook salmon and rainbow trout. On average, annual production includes 125,000 rainbow trout, 144,000 Chinook salmon, 14 million walleye fry, 1.7 million walleye fingerlings (goal is 2 million), 5 to 10 thousand advanced fingerlings, and 1.5 million northern pike.

Giant Springs Trout Hatchery

Located on FWP land adjacent to Giant Springs State Park north of Great Falls, Giant Springs is an FWP production facility. Annual production includes 3 strains of rainbow trout (about 600,000 fish) and brook trout (about 41,000 fish).

Jocko River Trout Hatchery

Located on FWP land in Arlee, the primary activity at the Jocko River hatchery is to maintain the Arlee rainbow trout brood stock, a domestic rainbow trout strain. Production and distribution is shared with other FWP hatcheries. Annual rainbow production is typically 260,000 fingerlings and 1,350 depleted brood fish.

Miles City Fish Hatchery

Miles City Fish Hatchery is located on FWP land 2 miles southwest of Miles City and is one of two FWP warm-water and cool-water hatcheries. On average, annual production includes 3,000 juvenile pallid sturgeon, 10 million walleye fry, one million walleye fingerlings, 5 to 10 thousand advanced walleye fingerlings, 350,000 northern pike fingerlings, and 325,000 largemouth and smallmouth bass fingerlings. The hatchery receives walleye and northern pike eggs from the Fort Peck hatchery and maintains resident largemouth and smallmouth broodstocks. The Miles City Hatchery is also a spawning facility for captured wild, adult pallid sturgeon.

Murray Springs Trout Hatchery

Murray Springs Trout Hatchery near Eureka is operated as a State Fish Hatchery and is included in the Montana Hatchery System for planning purposes; however, Murray Springs Trout Hatchery is owned by the U.S. Army Corps of Engineers and is operated under contract by FWP. All funding for operating the hatchery comes from the Corps of Engineers. Its primary activities involve the production and distribution of rainbow, cutthroat, and kokanee salmon as partial mitigation for the loss of habitat associated with the impoundment of Lake Koocanusa by Libby Dam.

Rose Creek Hatchery

Rose Creek Hatchery (a satellite facility for Flathead Lake Salmon Hatchery) became fully operational in 2011/12. The primary activity is the incubation and production of kokanee salmon, grayling and westslope cutthroat trout.

Washoe Park Trout Hatchery

Located on FWP land adjacent to the city limits of Anaconda, the main function of the Washoe Park hatchery is to maintain and enhance Montana's captive westslope cutthroat trout broodstock and supply eggs to various in-state and out-of-state agencies (approximately 500,000 eggs are kept onsite and one million are shipped to other hatcheries). Production and distribution of cutthroat are shared with other FWP hatcheries. Annual westslope cutthroat production includes 165,000 fry, fingerlings and depleted brood. Washoe Park produces some triploid (sterile) westslope cutthroat trout for stocking situations where a sterile fish is preferred, mostly in areas of native species restoration efforts. Washoe Park is also involved with research efforts including the comparison of performance between diploid and triploid westslope cutthroat trout.

Yellowstone River Trout Hatchery

Located on FWP property adjacent to Big Timber, the Yellowstone River Trout Hatchery's main purpose is to maintain Montana's captive Yellowstone cutthroat and Big Hole river fluvial Arctic grayling broodstocks, and provide eggs and fish to meet fisheries management objectives. It shares production and distribution with other hatcheries. Approximately 100,000 fish are planted annually.

There are two US Fish and Wildlife Service (USFWS) fish hatcheries in Montana, one in Creston and one in Ennis. The State Fish Hatchery Section works closely with the federal hatcheries to reach production goals. The Federal facilities are primarily responsible for stocking federal waters. Ennis National Fish Hatchery is a brood facility that plays a critical role in

providing state fish hatcheries around the country with rainbow trout eggs. The Creston National Fish Hatchery primarily provides trout for fisheries management activities on Tribal waters and for mitigation purposes. The hatchery also produces bull trout eggs and fry for research purposes. There are also multiple commercial, privately owned fish hatcheries in the state that sell fish primarily for use in private ponds.

Special issues, challenges or initiatives

The annual production of fish by FWP fish hatcheries varies depending on spawning success and fisheries management requests, but typically 45 million warmwater fish and 8.4 million coldwater fish are produced. Most of the warmwater fish are stocked as fry, thus total warmwater production amounts to less than 11,000 pounds of fish. Annual total weight of coldwater species typically exceeds 160,000 pounds. Several factors limit the amount of fish that is produced including egg supply, quantity and quality of water, hatchery space and operating budgets. Additionally, many of the species are grown at lower densities than is possible to produce a higher quality of fish. Many of the “wilder” strains of fish, including westslope cutthroat trout, do not tolerate being grown at higher densities and therefore become more susceptible to disease outbreaks. The Hatchery System works closely with fish managers to meet requests, and operates from a 6-year Stocking Plan that is updated annually.

Applicable laws, rules and policies

Statute (Montana Code Annotated, MCA):

87-1-201: The department shall supervise all the fish of the state and to enforce the fish and game laws for protection, preservation and propagation of fish. The department may spend for the protection, preservation, and propagation of fish.

87-1-301: The FWP Commission shall set the policies for the protection, preservation, and propagation of fish, nongame species, and endangered species of the state.

87-3-225: Provides FWP authority to inspect fish hatcheries or culture facilities for the presence of pathogens.

87-3-226: Requires hatchery and culture facilities to report the presence of fish pathogens.

87-3-227: Assigns liability for damages resulting from diseases to the violator. Damages may be recovered by a person, firm, corporation, or FWP.

87-3-201: Gives the department authority over hatcheries and for the taking of eggs.

87-4-606: Identifies the conditions for acquiring and renewing pond licenses.

87-4-601: Makes it unlawful for any person (other than FWP) to sell any game fish or the eggs or spawn from any game fish. Exceptions are identified in the statute.

Administrative Rule (Administrative Rules of Montana, ARM):

12.7.506: Disease inspection and quarantine procedures for hatcheries and culture facilities.

12.7.901: FWP may sell eggs from its brood stock only when the eggs are surplus to its needs and when the eggs are certified disease free and are not available from private sources within the state. Eggs from natural runs will not be sold.

12.7.601: General Administrative Rules for fish planting.

12.7.602: Stream planting rules, including restrictions pertinent to impacts on wild fish populations.

12.7.701: Provides authorization for FWP and commercial fish planting (if approved by FWP) of specific fish species, lists specific species which are approved for introduction.

Departmental Policies:

Hatchery Stocking, Policy. Provides direction regarding the stocking of excess or unallocated fish from the hatchery system.

Fish Stocking into Waters that Require an Environmental Assessment, Policy. Provides direction regarding fish stocking into waters that require an environmental assessment.

Walleye Stocking, Policy. Provides direction regarding walleye stocking beyond their existing range in Montana.

Fish Health

The introduction of potentially harmful fish pathogens and disease into both captive and wild fish populations within Montana can have long-lasting, detrimental effects. The goal of the fish health program is to prevent the introduction and spread of these dangerous organisms both into and within the state, and to help better understand and reduce the impacts of these diseases where they are present.

Description of current operations and/or areas of work

Any time that live fish, eggs, or dead fish parts are moved between waters there is a risk of inadvertently moving harmful disease causing organisms. In order to minimize those risks, hatchery and wild fish are routinely screened for certain pathogens to reduce the likelihood of moving them. Wild fish are tested before being moved to other waters, and all state, federal and private hatcheries are tested annually. Live fish imports from out of state are reviewed and import permits are issued to help reduce the risk of introducing pathogens with imported fish. The FWP Fish Health Committee reviews management actions that are considered high risk for spreading harmful pathogens. Diagnostic examinations are conducted where problems do occur to determine and document the cause and extent of the problem.

Special issues, challenges or initiatives

Myxobolus cerebralis, the parasite that causes whirling disease, was discovered in Montana in the mid-1990's. Since then it has become widespread in the state and has had significant impacts on numerous fish populations. Viral Hemorrhagic Septicemia (VHS) was discovered in the North American Great Lakes in 2004. While it has not been detected and is not believed to be present in Montana, it has had significant impacts on many of our fisheries programs. The live transport of various fish species between states causes continued concerns that this devastating disease may become introduced at some point in the future.

Applicable laws, rules and policies

Statute (MCA):

87.3.210 –26: Fish Importation Statutes

Administrative Rule (ARM):

12.7.501 –7: Fish Disease Certification and Importation Rules

Departmental Policies:

Fish Health Policy. Aids fisheries managers, biologists, hatchery managers, fish culturists and fisheries administrators in implementing fish health programs to insure fish health, prevent disease and reduce the spread of fish pathogens in Montana.

Wild Fish Transfer Policy. Provides direction to ensure that movement of wild fish by FWP personnel is compatible with overall stewardship of Montana's fishery resources.

Aquatic Invasive Species

Aquatic Invasive Species (AIS) are a serious threat to Montana. AIS are transported by humans, boats, gear and equipment, or are intentionally moved from one area to another. AIS of highest current concern are zebra/quagga mussels, Asian carp, Viral Hemorrhagic Septicemia Virus, and aquatic noxious weeds, e.g., Eurasian watermilfoil. Prevention is the key management tool. Unfortunately there are very few options available to control and manage AIS once established, and eradication is costly and often impossible. The impacts of AIS include clogging water conveyance systems, which can significantly impact agricultural irrigation and utilities. Other impacts include impairment or loss of recreational opportunities and ecological disturbance.

Description of current operations and/or areas of work

To date (July 2012), Montana does not have any established populations of the most damaging AIS, although Eurasian watermilfoil has become established in a number of locations. In order to prevent the establishment of these species in Montana, continued support of the AIS program is essential. The program needs to be multi-faceted, including the following components: Coordination, Outreach and Education, Prevention, Early Detection and Monitoring, and Rapid Response.

Montana's AIS Management Plan was approved by then-Governor Martz and the National Aquatic Nuisance Species Task Force in 2002. The first Statewide AIS Coordinator was hired in 2004. The program expanded greatly after the 2009 legislative session passed the first AIS Act, and expanded again after the 2011 legislative session authorized additional funding for the program. Currently the AIS effort in Montana is administered by FWP, the Montana Department of Natural Resources and Conservation (DNRC), and Montana Department of Agriculture (MDA). FWP coordinates the AIS program, leads the watercraft inspection program, and has the lead on any AIS that are animals or pathogens. MDA has the lead on aquatic noxious weeds along with the Counties.

Special issues, challenges or initiative

The Montana public is becoming increasingly aware of AIS and associated issues. Prevention strategies, such as watercraft inspection stations, can be viewed by some water recreationists as an inconvenience. The FWP AIS Watercraft Inspection Program inspects more than 15,000 watercraft annually. Angling organizations, such as Walleyes Unlimited and Trout Unlimited, have been very supportive of the FWP AIS Program. The FWP AIS Program recognizes the importance of gaining local and statewide support and works closely with a variety of non-governmental organizations, local governments, state and federal agencies.

Another issue is illegal introduction of fish species into waterbodies. FWP conducts extensive environmental analysis before introducing a species into a waterbody in order to prevent unwanted, and sometime catastrophic, impacts. Illegal introductions lack any environmental analysis and can negatively impact native fish and existing recreational fisheries. Illegal introductions can also result in introduced diseases and reduced water quality. This in turn has increased the need for management and hatchery fish, which costs money. The end result of illegal fish introductions is reduced fishing opportunity and higher fishing license fees.

Montana has now documented more than 600 illegal fish introductions involving 50 species of fish and into nearly 300 waters spread across the state. Illegal introductions can occur from the illegal use of live fish bait and dumping bait buckets, release of aquarium fish, and the intentional illegal transfer of fish between waters. In some small waters illegally introduced fish can be successfully removed or suppressed, but in most cases the introductions are irreversible and permanent. The best solution is prevention by educating people about the significant harm caused by illegal introductions and the importance of obeying the law.

It may be necessary to consider additional actions if illegal introductions continue to occur. As a disincentive to further illegal introductions, for example, FWP may consider prohibiting the harvest of a fish species (e.g., panfish) in a waterbody where it was illegally introduced by people for the purpose of consumption. Similarly, FWP could make it a policy not to manage illegally introduced game fish (e.g., FWP would not impose fishing limits on pike, bass or walleye that were illegally introduced by people wanting them for sport).

Applicable laws, rules and policies

Statute (MCA):

87-1-207: Authorizes the use of check stations to check licenses and fish in possession.

87-3-105: It is unlawful to import for introduction or to transplant or introduce any wildlife into Montana except in accordance with 87-5-701 through 721.

87-3-210: A FWP permit is required to import live non-salmonid fish or eggs except when intended for use in home or office aquarium. A permit is always required to import salmonids (87-3-221).

87-3-221: Specifies the certification requirements for importation of salmonid fish or eggs.

87-3-222: Dead salmonid fish or eggs may be imported if they have been processed or prepared in a manner to kill those pathogens specified by FWP as posing a threat to fisheries.

87-3-223: Provides rulemaking authority for importation testing and inspection.

87-5-701: To protect native wildlife and plants, and agricultural production, the state can prohibit the importation for introduction and the transplantation or introduction of wildlife in the state unless it can be shown that no harm will result.

87-5-705: Allows the importation, possession, or sale of exotic wildlife only if it is allowed by law or commission rule. Provides rulemaking authority to designate lists of noncontrolled, controlled, or prohibited exotic wildlife.

87-5-721: Defines penalties for violation of importation and introduction

80-7-1001-14: Montana Aquatic Invasive Species Act. Establishes Departmental responsibilities, rulemaking authority, the ability to establish invasive species management areas and associated check stations, and includes a penalty section.

Administrative Rule (ARM):

12.11.34: Aquatic Invasive Species Inspection Station Rule. Provides FWP with the authority to establish inspection stations for the purpose of inspecting watercraft for the presence of aquatic invasive species, and establishes protocols if an invasive species is found at an inspection station.

12.5.701-703: Restrictions for contaminated waters, includes bait use restrictions and transfer of fish and bait from contaminated areas.

Departmental Policies:

Illegal and Unauthorized Introduction of Aquatic Wildlife, Policy. The purpose is to clearly state the approach for dealing with illegal and unauthorized introductions of aquatic species. For purposes of this policy aquatic species include any fish, insects, crustaceans, mollusks or other species requiring aquatic habitat to complete its life cycle.

Bait Regulations and Live Fish Transport

Bait is of particular concern to fisheries management for the reason that it can serve as a vector for fish pathogens and AIS. The primary challenge with live bait use in Montana is providing clean sources of bait, i.e., minimizing the risk of either AIS or pathogen introductions. Another challenge is preventing the over-harvest of native minnows while also providing bait fish for the angling public. Due to the risk of importing pathogens or AIS from out of state sources, no live bait fish may be imported into Montana except by permit for use in Big Horn Lake and Afterbay Reservoir only. The majority of bait fish sold commercially is collected within the lower Yellowstone River drainage. Long-term this may not be a sustainable option due to the lack of adequate supply and the potential impact to native minnows.

Description of current operations and/or areas of work

FWP bait regulations allow for a diversity of fishing opportunities while providing protection to the aquatic ecosystems. The bait regulations are widely varied across the three fishing districts in the state, particularly for the use of live fish as bait and the transport of live fish.

Statewide restrictions include:

- It is illegal to release live bait of any kind into Montana waters;
- Live bait fish may not be imported into Montana, except by permit on Bighorn Lake and Afterbay Reservoir;
- Leeches can only be imported into Montana from FWP-approved out-of-state bait dealers;
- An FWP import permit is required to bring live fish of any kind into Montana.

The three fishing districts' bait regulations can be broadly summarized as follows:

Western Fishing District

- Possession of live fish or use of live fish as bait is prohibited;
- Live bait animals may be used on all waters except where restricted to artificial lures or flies.

Central Fishing District

- Possession of live non-game fish is prohibited on waters closed to using live fish as bait;
- Live fish may be used as bait on selected waters, and where allowed, legal non-game fish may be taken for use as bait;
- Live bait animals may be used on all waters except where restricted to artificial lures or flies;

- Live fish cannot be taken away from any body of water in which the fish were taken except where being transported for commercial purposes, or where allowed by bait regulations.

Eastern Fishing District

- Live bait fish are allowed for use on most of the waters throughout the Eastern Fishing District;
- Where live fish may be used as bait, legal non-game fish may be taken for use as bait;
- Live bait animals may be used on all waters, except where restricted to artificial lures or flies;
- Live fish can be transported away from the body of water from which they were taken within the boundaries of the Eastern Fishing District.

Special issues, challenges or initiatives

In 2012, additional bait restrictions, and restrictions on the movement of live fish, were adopted in some locations due to the presence of Eurasian watermilfoil (EWM), an invasive aquatic weed. Within EWM-contaminated areas, no collection of bait organisms can occur, and the transport of bait organisms and live fish from contaminated waters can only occur in clean water from an uncontaminated source. The new regulations were adopted to minimize the risk of transfer of EWM to new waters while still maintaining the use of bait minnows where currently allowed by fishing regulations.

Bait as a vector for AIS and fish pathogens has become an increasing concern throughout North America, especially with the spread of Viral Hemorrhagic Septicemia and Asian carp, both of which have been demonstrated to be moved around with live bait fish. Many states have changed bait regulations as a result of AIS or pathogen threats, including restricting where bait fish can be used, collected and transported. Many states are using “certified” bait fish from sources that have been tested for pathogens and AIS. Some states do not allow the transport of bait from the bodies of water where they were collected.

The concern in Montana is how to maintain the use of bait fish where currently allowed, while not increasing the risk of AIS or pathogen introduction or spread. An additional concern is the potential over-harvest of bait fish from the Yellowstone drainage. Additional restrictions, which could be considered in Montana, might require the use of certified bait fish and/or prohibit the transport of bait from the body of water where the bait was collected. Currently, there are two bait fish producers in the state that are considered certified for fish pathogens and AIS. A preferred option would be to increase the in-state supply of certified bait fish. Another option is to import certified bait from out of state, although this would be considered a higher risk option.

Applicable laws, rules and policies

Statute (MCA):

87-3-203: FWP may prohibit the use of small fish as bait. Gives rulemaking authority for FWP to insure an adequate supply of fish in waters regulated for the taking of bait fish, and to

regulate fishing from boats or other floating devices and the use of fishing lures or baits in all waters of the state.

87-3-204: FWP may designate waters for the taking of minnows other than game fish variety by the use of a net (not to exceed 12 feet by 4 feet), and the taking of whitefish by nets or traps in the Kootenai River and tributaries (within one mile of the Kootenai River).

87-3-205: Makes it unlawful to possess any seine, net or other similar device for capturing fish unless authorized by FWP (pond license, seine license). FWP may designate waters where traps, seines, or nets may be used for taking nongame fish and Dolly Varden trout.

87-4-602: FWP shall keep a record of all seining licenses issued including the name, date of issue, and specified waters. A license may not be issued to a person whose license has been revoked.

87-4-608: Crayfish may not be taken from state waters (except private fish ponds) for sale or commercial distribution.

Administrative Rule (ARM):

12.5.701-3: Restrictions for contaminated waters, includes bait use restrictions and transfer of fish and bait from contaminated areas.

12.7.201: Establishes the licensing requirements for seining any nongame fish (exceptions identified).

Management Planning

As warranted, FWP develops fisheries management plans for individual waterbodies and/or individual fish species. These plans identify the management direction for a species or collection of species within a waterbody or a broader geographic area such as a drainage or state. The plans describe the resource being managed, the rationale (both biological and social) for management direction being taken, and specific actions that will be implemented to accomplish plan goals and objectives. There are two primary audiences for fisheries management plans: FWP and the public. The agency benefits because the effort ensures that staff must deliberate and evaluate management actions to ensure they are consistent with, and adequate to achieve stated goals and objectives. Through this process, a written record is created, which serves to provide continuity over time as fisheries management agency personnel changes. The public benefits from a well-constructed and transparent plan because it becomes a ready source of information, which helps them understand the rationale behind agency activities such as fishing regulations, stocking practices and habitat restoration projects. The planning process also provides a venue or opportunity for the public to help shape management direction for that area or relevant species. Seeking the input from the public also fulfills a legal obligation to ask the users of the resource for their opinion and ideas.

Description of current operations and/or areas of work

All management plans developed by FWP must respect and strive for consistency with other jurisdictions that have authority over fishery resources. Jurisdictions with exclusive authority over fishery resources include Glacier and Yellowstone National parks and the Montana Indian Reservations. Flathead Lake is a unique example of a shared jurisdiction requiring co-management with the Confederated Salish and Kootenai Tribes (CSKT) and development of a plan with goals and objectives agreed to by both parties. Another unique jurisdictional situation arises in the case of fisheries management in Wilderness Areas. Federal law and courts have acknowledged the primacy of states to manage waters in Wilderness Areas. There are certain management activities that evaluated to accommodate restrictions on the use of mechanized equipment as provided for in the Wilderness Act. Through an Agreement with the U.S. Forest Service (USFS), the Bureau of Land Management (BLM), and the Association of State Fish and Wildlife Agencies, mechanized means (such as helicopters or all-terrain vehicles) to stock waters within a Wilderness Area are permitted only if such practices were in effect prior to the creation of the affected Wilderness Area. In the case of lakes in the Absaroka-Beartooth Wilderness, for example, this agreement means that lakes stocked by airplane or helicopter prior to 1964 may continue to be stocked in such a manner. Stocking that was initiated post-Wilderness designation may continue but must be done on foot or through the use of pack animals.

Special issues, challenges or initiatives

This Statewide Fisheries Management Plan is the first of its kind for Montana. Prior to it, management plans have been developed for individual waterbodies (e.g., Flathead Lake Co-Management Plan, Fort Peck Reservoir Management Plan), collections of waterbodies (Upper Missouri River Reservoirs Fisheries Management Plan), or species groups (e.g., Warmwater Fisheries Management Plan). One drawback to the individual waterbody plans in Montana is that there are specific management actions and goals provided for species within the geographic area of the management plan, but no corresponding written goals or actions in waters immediately adjacent. An example of this would be the sections of the Missouri River above and below Fort Peck, which have no specific management goals for walleye, while goals do exist for the reservoir itself. While FWP strives to ensure consistent management between areas covered and not covered by plans, the statewide plan should help to rectify the potential for confusion by putting in writing, for the first time, management direction for all principal species in major waterbodies. This plan is intended to integrate the management direction already identified in the waterbody specific plans and waters not previously described.

Applicable laws, rules and policies

None identified.

Angler Surveys

The Statewide Angling Survey has been conducted by mail every other year since 1985 and provides an accurate biannual estimate of angling pressure on individual lakes and streams of the state. This survey provides fisheries managers, administrators, and the public a reliable measure of angling pressure (angler days) for use in making decisions about fishing regulations, fishing access sites, development of fisheries management plans, and allocation of funds. The survey also serves as a factor in determining the total economic value of an individual or composite

fishery, and refines and updates FWP's net economic values for cold-and warm-water streams and lakes. It is also used to update information about the attitudes and preferences of anglers.

Description of current operations and/or areas of work

Angler success (catch and harvest rates, size and number of different species) is determined using standard creel census methods and mail/telephone surveys. Specific waters surveyed annually are selected according to management needs. Some waters are surveyed on an annual basis, while others may not be surveyed more than once every five or more years. The creel census involves creel clerks interviewing individual anglers, handing out questionnaires to anglers, and placing questionnaires at trailheads for use by backcountry anglers. Aerial surveys and car counters are sometimes used to count anglers using large or remote fishing waters. Mail and phone surveys are occasionally used to target either randomly selected anglers or a specific angling group. Currently, FWP conducts phone surveys of paddlefish tag holders and mail surveys of bull trout catch-card holders.

Special issues, challenges or initiatives

The next statewide angling survey is scheduled to begin in the spring of 2013. Efforts are currently underway to evaluate the potential to incorporate email or automated electronic survey techniques as a vehicle for gathering fishing patterns of licensed anglers. The impetus for this innovation is the need to find more economical approaches than mail, which increases in cost as the price of postage continues to rise.

Applicable laws, rules and policies

None identified.

Permitted commercial and private activities

FWP regulates a number of commercial and private activities related to fish and other aquatic resources. The FWP website includes more details on the permitting process and the dollar amounts for those that are subject to a permit or license *fee*. The following is a summary of these activities and the license or permits required (see Fishing Access and Recreation Management section of the plan for more information on commercial use of fishing access sites and waterbodies).

Bait Collection (license and fee required)

FWP has the authority to regulate the use of fish as bait (87-3-203, MCA). Bait fish collection and use (for both private and commercial purposes) is allowed throughout the state but with varying restrictions depending on the fishing district, as described in the fishing regulations booklet. The FWP Commission (under authority of 87-3-204, MCA) may designate waters where commercial fishing (including bait collection) may occur. A license is required for bait collection (ARM 12.7.201 through 203). A bait fish seining license is required of someone who seines for, and has in his/her possession, more than 24 dozen non-game bait fish, and for persons 15 years of age and older who are seining and transporting bait fish for commercial purposes.

Commercial Fishing (license required)

The commercial sale of fish or spawn is authorized under 87-4-601 et seq. (MCA), including paddlefish roe, nongame fish, whitefish, crayfish and mysis shrimp. This statute and ARM 12.7.1001 et seq. describe the circumstances and process by which paddlefish roe can be obtained at the Intake Dam Fishing Access Site and sold by a nonprofit organization. The nonprofit corporation is currently the Glendive Chamber of Commerce. Whitefish may be taken commercially by hook and line for sale in the Flathead River north of Flathead Lake, in Flathead Lake north of the Flathead Reservation boundary, the Fisher River, Kootenai River and Whitefish Lake. Whitefish, along with nongame fish, may also be harvested for sale through the use of nets or traps from the Kootenai River or its tributaries within one mile of their mouths as authorized by ARM 12.7.101 et seq.

Fishing Contests, a.k.a. Fishing Derbies (permit required, fee varies)

A permit is required to conduct a fishing contest on Montana waters where FWP has jurisdiction (12.7.801 et seq., ARM). The rules define a “fishing contest” as any event where an entry fee is charged or where people are expected to, or do, compete for prizes or cash based on the capture of individual fish or combinations of fish. Contests involving fewer than 30 people or merchandise worth \$500 or less do not require a permit but must comply with contest provisions. Contest applications may be denied for a variety of reasons including if there is significant public opposition, detrimental impacts on fish populations, or conflicts with other contests or management goals for host waters. FWP may also place conditions on permits to alleviate issues such as those described above. Contests involving species of special of special concern are prohibited, with the exception of lakes and reservoirs stocked with Yellowstone cutthroat trout or westslope cutthroat trout. Contests involving wild trout in rivers and streams are also prohibited, as are contests on holiday weekends. Fees may be applied to contests using FWP fishing access sites.

Hoop Net Fishing (permit required)

A permit is required to use hoop nets to capture fish, and this practice is only allowed in the Eastern Fishing District by licensed resident anglers. Permit applications and rules are available at the FWP Regional offices in Billings, Miles City and Glasgow.

Private Fish Ponds (permit and application fee required)

Based on state law first passed in 1945, (MCA 87-4-601 et seq.) FWP administers private fish pond licensing. This law and the accompanying FWP Private Pond Stocking Policy (approved August 30, 2002) allow the stocking of private fish ponds while ensuring that public resources are not adversely affected by unwanted fish or fish diseases, that nuisance aquatic species are not planted into ponds where they can escape or be introduced into state waters, and that the habitat of wild fish is not harmed.

Any person who owns an artificial lake/pond or a natural lake/pond smaller than 500 acres with a tributary that doesn’t support fish may apply to FWP for a permit. FWP cannot issue fish stocking permits until it is certain that legal water rights exist (if needed) for the pond or reservoir. Owners are not permitted to stock fish ponds that are likely to flood, and on-stream ponds are not be permitted unless it can be demonstrated that there is no threat to game fish or native species of special concern in adjacent waters. FWP has the authority to designate the

species of fish that may be stocked into the pond and may condition any permit to require construction and/or maintenance of devices to ensure there will be no escape of fish. The Pond Stocking Policy provides more specific guidance on circumstances where stocking of non-native trout species is permissible, under the general philosophy that such stocking is permissible if it is expected to have minor or no additional impact to native fish species, or important non-native sport fisheries. As an example, the stocking of rainbow trout in private ponds within tributary drainages that support or are connected to habitats that support westslope cutthroat trout will not be allowed due to the risk of genetic hybridization.

Scientific Collections (permit and fee required)

It is lawful, under Montana statute (87-2-806 MCA) and rule (12.7.1301 ARM) for a representative of a school, college, university, government agency, or an individual, to collect fish for the purpose of a scientific investigation. To do so, they must apply for a permit and in the application they must describe the purpose of the collection, collection methodologies, and qualifications of those who will be doing the collecting. Based on the application, FWP may issue a permit without restrictions or may place special conditions on the permit such as restrictions on the time or location of the collections. FWP may also deny a permit if the applicant is not qualified, the proposed collections are not necessary, the method of collection is not appropriate, or if the collecting may threaten the viability of the species. By December 31 of each year, the permittee is required to provide FWP with data collected under authority of the permit. In recent years, FWP has issued about 40 permits annually, mostly to Universities and state and federal agencies, but also to consultants. Collections are typically made using electrofishing to monitor fish populations on public lands.

Native Species Program

Montana is home to 51 native fish species and a number of subspecies that occupy streams, lakes and reservoirs in all regions of the state. The assemblage includes well-known sport fish like burbot (ling), channel catfish, cutthroat trout, sauger and paddlefish. Others native species, like the blue sucker, emerald shiner, and freshwater drum are not identified as sport fish, or even recognizable by most Montanans, but they are an equally important part of Montana's natural heritage and they fill essential biological roles in our streams, rivers and lakes.

Montana is fortunate that many of our native fish species remain quite common, and if suitable habitat is maintained, they will continue to thrive for the foreseeable future. There are notable exceptions, however, and 18 species are listed as Montana Species of Concern (SOC), meaning they are "at-risk" due to declining or significantly reduced abundances, threats to their habitat, and restricted distribution. The list includes shortnose gar, redband trout, sicklefin chub, and westslope and Yellowstone cutthroat trout, which are collectively known as *Montana's State Fish*. Three Species of Concern have also been listed under the federal Endangered Species Act, including *threatened* bull trout, and *endangered* pallid and white sturgeon.

A primary goal of FWP's fisheries program is to protect, maintain, and restore native fish populations, life histories, and genetic diversity, and continue to provide angling opportunities for native species whenever possible. This goal is backed by FWP policy and state law, which require FWP to implement programs that manage sensitive native species in a manner that assists

in the maintenance or recovery of those species, and that prevents the need to list the species under the federal Endangered Species Act (ESA).

Description of current operations and/or areas of work

Approaches to native fish management vary greatly by species and their status, region of the state, body of water, and management objectives. Native fish are often managed as part of larger fish assemblages that may include multiple native, non-native, game, and non-game species. The native components of these fisheries are maintained through standard management activities that include balancing predators and prey, habitat conservation and restoration, and harvest regulations. Management of Montana Species of Concern can also be more focused, and specific programs have been developed for those in greatest need.

Pallid sturgeon, paddlefish, sauger, burbot, Arctic grayling, and bull and cutthroat trout are among the native species that receive significant management attention and there are fisheries staff dedicated to their management, conservation and restoration. Three native species (bull trout, pallid and white sturgeon) are listed as threatened or endangered by the ESA, and a determination for Arctic grayling listing is scheduled to occur in 2013. Management of these species is often guided by collaborative agreements with other resource agencies, tribes and private organizations, which share common goals and resources to implement conservation and recovery programs. These programs vary greatly with respect to species focus, but all focus on promoting the long-term goal of self-sustaining persistence. Essential to these efforts is the proper management, and restoration as necessary, of natural habitat systems that sustain the wide diversity of Montana's native species. Though ultimate recovery planning efforts for federally listed species are guided by the US Fish and Wildlife Service (USFWS), FWP and other resources agencies and organizations are crucial partners in the development, funding, and implementation of threatened and endangered species management programs. Several species-specific agreements and management plans have been developed by FWP, partner agencies, tribes, and private resource organizations for coordinated efforts to conserve Arctic grayling, bull trout, and westslope and Yellowstone cutthroat trout.

Special issues, challenges or initiatives

Alteration of the natural environment is a primary reason for the reduction in distribution and abundance of many native species, and it is a key consideration in all recovery efforts. Dams and impoundments have caused significant habitat changes to many rivers, and also impede necessary migrations of several species. Status and potential recovery of *endangered* pallid and white sturgeon are directly linked to dam construction and operation on the Missouri and Kootenai rivers. Arctic grayling, paddlefish, sauger and *threatened* bull trout are also among the numerous Montana Species of Concern impacted by dams and other impediments to movement. Size, design and operating mandates (e.g., flood control, power production and irrigation) of dams like Fort Peck, Libby and Intake are significant challenges to mitigating the damage of these structures on natural river ecosystems, and potential solutions to their impacts on native fish remain uncertain. Challenges aside, throughout Montana projects are being implemented to provide better fish passage through the modification or removal of culverts, irrigation diversions and dams (e.g., Milltown), and the construction of fish ladders and by-pass channels.

Of equal importance, the presence of *non-native fish* in Montana (species that are not native to the state) has forever changed the status and management of many native species. Non-native fish can compete and hybridize with, prey on, and displace native fish, including game and non-game species. Challenges associated with non-native species are wide-spread, and include significant concerns like walleye (non-native) hybridization with sauger (native), competition between brook trout (non-native) and cutthroat trout (native), predation of bull trout (native) by lake trout (non-native³), and hybridization between rainbow trout (non-native) and cutthroat and redband trout (native).

In certain locations, the impacts of non-native species are addressed through liberalized harvest regulations, active suppression or eradication of the undesirable species, maintenance or placement of barriers to prevent invasions of non-native fish, and stocking of species native to that particular water. Assemblages of native and non-native species alike provide important fisheries in Montana, and balancing the management of sensitive native species with other fisheries management objectives is an important component of FWP fisheries management.

Applicable laws, rules and policies

Statute (MCA):

87-1-201: Directs FWP to implement programs that manage sensitive native species in a manner that assists in the maintenance or recovery of those species, and that prevents the need to list species under the federal Endangered Species Act (ESA).

Direction for Individual Species or Groups of Species

Arctic grayling (native; federal ESA candidate species; Montana Species of Concern)

Arctic grayling (*Thymallus arcticus*) are native to the Missouri River drainage in Montana and have been stocked in numerous lakes in the western third of the state. Native “fluvial” grayling, those that reside in rivers and streams, were historically widespread throughout the upper Missouri drainage upstream of Great Falls. Habitat changes and the introduction of nonnative fish have significantly impacted the distribution of fluvial grayling, and the lone remaining population in Montana (and the entire lower 48 states) occupies the Big Hole River. Though similar in appearance, “lacustrine” or lake dwelling grayling are genetically different from the fluvial form. Native populations of the lacustrine grayling persist in four lakes in Montana, including upper and lower Red Rock lakes in the Red Rock drainage, and Minor and Musigbrod lakes in Big Hole drainage. Other introduced lacustrine grayling populations in Montana (about 100) are the result of fish originating from Montana (e.g., Big Hole and Red Rocks) or Canadian populations and include a recent conservation effort to “replicate” Red Rocks grayling in Elk Lake near Lima, MT. Fluvial Arctic grayling are a Montana Species of Concern and are listed as a “candidate species” under the federal Endangered Species Act (ESA). The USFWS is expected to make a final ESA listing determination for Arctic grayling in 2013.

³ Lake trout are native to Montana but not in lakes west of the Divide where they interact with bull trout.

Arctic grayling management in Montana includes activities directed towards providing recreational angling opportunities, and conservation and recovery of native populations. Approximately 100 lakes and reservoirs in western and south central Montana support grayling populations. These waters provide the bulk of angling opportunities for grayling in Montana and harvest is generally allowed under standard combined trout regulations. Most of these populations are self-sustaining but several are supported by periodic stocking efforts. The Rogers Lake grayling population (a mixed Red Rock Lakes and Big Hole strain) near Kalispell provides a source for the recreational stocking program in several western lakes, and FWP personnel from Flathead Lake Salmon Hatchery (near Kalispell) collect and raise eggs and fry for these efforts. FWP has developed two conservation broods from aboriginal Big Hole River fluvial stock for fluvial grayling restoration purposes and occasional lake stocking in south-central Montana. The conservation broods, maintained in two lakes in the Madison and Gallatin river drainages, are to be used in efforts to reestablish native fluvial grayling in portions of their historic range, including most recently the Ruby River near Alder, MT. The reestablished Ruby River grayling population, like all populations occupying streams and rivers, are protected from harvest by catch-and-release regulations.

Habitat alterations are a key factor in the loss of fluvial Arctic grayling in most of their historic range in Montana. In an effort to conserve and recover the remaining fluvial grayling population in Montana, over the last decade FWP and numerous partners have engaged private landowners in the Big Hole Valley to aid grayling recovery through enhancement of habitat. Implemented through a USFWS approved Candidate Conservation Agreements with Assurances (CCAA) program, the goal of the effort is to secure Arctic grayling in the upper Big Hole River by improving streamflow, protecting and enhancing stream habitat and riparian areas, increasing fish passage, and eliminating entrainment of fish in irrigation ditches.

An Arctic Grayling Work Group meets on an annual basis to develop grayling conservation strategies and work plans. The technical advisory group is chaired by FWP and includes participants from state and federal resources agencies, universities, and private interest groups. To formalize commitments to Arctic grayling conservation in Montana, in 2007, the *Memorandum of Understanding Concerning Montana Arctic Grayling Restoration* (MOU) was developed and signed by numerous state, federal and private stakeholders. The MOU commits the parties to a cooperative restoration program, and provides a means to obligate financial resources as they are available.

Bass (non-native)

There are two species of black bass in Montana: Largemouth bass (*Micropterus salmoides*) and smallmouth bass (*Micropterus dolomieu*) from the Sunfish (Centrarchid) Family. Both species are non-native and are considered cool water species, although largemouth are slightly more tolerant of warmer conditions. Both species are widely distributed throughout the eastern half of the state and locally in northwest Montana. Smallmouth are found in cool, clear lakes and streams while largemouth are more restricted to slower flowing water (backwaters) and lakes. Largemouth fisheries are best in northwest Montana in the lower Clark Fork reservoirs (Noxon Rapids, and Cabinet Gorge) and Echo Lake near Kalispell. Smallmouth bass fisheries are best in large rivers such as the lower Flathead River and Yellowstone River, as well as large reservoirs such as Fort Peck, Tongue River and Bighorn reservoirs. They are pursued by many sport

anglers (2.4% of total angler days) but are also highly sought after by many tournament anglers. Their ferocity as a fighter under angling circumstances contributes to their popularity, but their predatory nature can lead to challenges managing them in balance with their forage base. The recent expansion of smallmouth bass in the Yellowstone River has raised concerns that predation may be impacting sauger and native minnow populations.

Fishing regulations for bass are 5 daily and in possession for all Fishing Districts, although the Western District restricts harvest during the spawning period to 1 over 22 inches. FWP does raise largemouth bass at the Miles City State Fish Hatchery, and stocks them in numerous ponds and reservoirs in Eastern Montana, as well as Echo Lake in northwest Montana.

Burbot (native)

Burbot (*Lota lota*), also known as “ling”, are native to the Kootenai, Missouri, Saskatchewan, and Yellowstone river basins in Montana, and were introduced, with apparent minimal success, to the lower Clark Fork drainage in the 1970’s and 80’s. Burbot occupy many habitat types but are generally associated with larger rivers and cold water lakes and reservoirs. It is speculated that overall burbot abundance is currently greater in Montana than pre-European settlement times owing to the creation of cold water habitats within and below impoundments on traditionally warmer rivers (e.g., Nelson, Tiber and Fort Peck reservoirs). Though burbot populations are not closely monitored, the status of most is believed to be stable. An important exception includes the Kootenai River population, which has declined in Montana and Idaho due to habitat and flow regime changes resulting from the construction and operation of Libby Dam. The population was petitioned for federal ESA listing in 2000 but the petition was subsequently found unwarranted.

All Montana burbot populations are self-sustaining. Other than harvest regulations, the species is not actively managed. FWP fisheries biologists have recently devoted more attention to burbot and are evaluating methodologies to monitor their abundance in rivers, lakes and reservoirs. Although burbot angling pressure is relatively minor (about 0.1% of annual angler days), they are avidly pursued by some for harvest and consumption. The species provides a popular winter fisheries in reservoirs like Clark Canyon, Fort Peck and Newlan Creek. The current angler record for burbot is 17 pounds (Missouri River), though fish typically weigh less than 5 pounds.

Channel Catfish (native)

The channel catfish (*Ictalurus punctatus*) is a native game species found primarily in lowland lakes and large rivers east of the Continental Divide. It thrives at water temperatures above 70°F and tolerates turbid water. Principally it is found in the Yellowstone River downstream of Billings, along with major tributaries such as the Bighorn, Tongue and Powder rivers. In the Missouri River, it is found downstream of the Great Falls and in major tributaries such as the Marias, Teton, Milk and Musselshell. At least some of the populations in the state are migratory, with mature fish moving many miles upstream to spawn. Notable among these populations are the catfish that move out of the Missouri into the Musselshell to spawn. During these movements, fish may congregate near the mouths of the tributaries, making them more vulnerable to angling.

Spawning takes place in nests built by the male in holes in undercut banks, log jams or rocks. Once hatched, and as the fish grow older, their preferred habitat includes waters with little

velocity. Catfish achieve this in rivers by occupying backwaters, pools and sheltered habitat, and by orienting to the bottom where water is slower. It is from these lairs that the catfish pursues food sources, primarily at night. Channel catfish eat a variety of foods, including crayfish, insects, snails, clams, worms and fish.

Angling is most successful through the use of setlines with live or dead bait. Most fish are sought for consumption, although there is a small contingent of catch-and-release tournament anglers in Eastern Montana. Overall, angling pressure for this fish is low, although it can be seasonally high where fish congregate. This has led to a change towards more restrictive regulations in 2012 due to largely anecdotal evidence that suggested populations may be declining. The change was from 20 daily and in possession to 10 daily and 20 in possession. This species is only occasionally cultured and the wild populations fluctuate as natural conditions allow. As such, FWP will endeavor to find means to monitor this fish species to ensure harvest is at levels that do not exceed natural production.

Crappie (non-native)

Montana has introduced populations of both white (*Pomoxis annularis*) and black (*Pomoxis nigromaculatus*) crappie. They prefer ponds, lakes, reservoirs and slower rivers and sloughs. Popular Montana crappie fisheries include: Tongue River Reservoir, Fort Peck, Nelson, Yellowtail, although crappie have recently been showing up as illegal introductions in the natural lakes of Northwestern Montana, which is very concerning for FWP.

These warm/coolwater panfish feed mainly on zooplankton and small fish. Like yellow perch, crappie tend to overpopulate and become stunted in small bodies of water and tend to have cyclical population structures where really good fishing for larger fish occurs only in occasional years. Size structure and abundance of crappie populations can be impacted by a combination of angler harvest, predation by other fish species, and competition for limited food resources with other species like yellow perch and sunfish.

FWP does not produce crappie in the hatchery system but does occasionally transfer wild fish from existing fisheries to ponds that have experienced winter kill, or to establish a new fishery. Crappie are very catchable at least seasonally, and are highly sought after as a food fish. They account for 0.53% of the total statewide fishing days. The standard Eastern District regulations are 15 daily and 30 in possession with the exception of Tongue River Reservoir that currently has a 30 daily and 60 in possession limit. There are no bag limits for crappie in the Central and Western fishing districts where they tend to be less common. Quality fish usually start at around 9-10 inches, but that can vary depending on fish condition factor (weight at length), which of course depends on forage quality and availability. The state records for crappie are 3.13 lbs for black and 3.68 lbs for white crappie, both out of Tongue River Reservoir.

Kokanee salmon (non-native)

The kokanee (*Oncorhynchus nerka*), also called bluebacks or silvers, is the landlocked form of the sockeye salmon. Historically sockeyes never reached Montana due to natural barriers; all populations in Montana originated from stocking. The species is now found in several natural lakes and reservoirs in the western part of the state, primarily west of the Continental Divide. Spawning takes place along lake shorelines or in streams with good clean gravels. If born in

streams, fry will migrate quickly upon hatching to still waters where they will grow to maturity in 3 or 4 years eating zooplankton almost exclusively.

Growth of this fish can be rapid and is density dependant. Where populations are dense, fish may mature at 10-12 inches, while low densities may produce 18-20 inch fish. In most circumstances, FWP uses liberal bag limits or a predatory species such as gerrard rainbow trout or tiger muskellunge to reduce densities of kokanee. Occasionally, FWP has struggled to maintain populations in some waters. The Upper Missouri River Reservoirs (Holter and Hauser) have lost much of the kokanee fishery due to reservoir operations and flushing losses, compounded by walleye predation. The Flathead Lake population collapsed after *Mysis* shrimp both competed for food resources and helped predatory lake trout to increase dramatically.

Lake May Ronan has been used as the primary brood source for kokanee propagation for many years. The Flathead Lake Salmon Hatchery on Flathead Lake collects wild spawn and several state hatcheries hatch and rear fish to fry or fingerling size. These fish are stocked in lakes with poor natural recruitment, including most notably the Helena Regulating Reservoir, the Thompson Lakes, and Deadmans Basin Reservoir. Bitterroot Lake has a unique population of kokanee that achieves large sizes, and hatchery staff is currently attempting to culture this fish to determine if this trait is genetic or behavioral.

Lake whitefish (native to St. Mary River drainage, non-native otherwise)

Lake whitefish (*Coregonus clupeaformis*) are members of the salmonid family, and although uncommon in Montana, they are a popular sport fish for a small, but dedicated group of anglers. Lake whitefish generally prefer deep, coldwater lakes, but can also be found in relatively warmer lakes and reservoirs, and rivers during spawning migrations. In Montana, the species is believed to be native to the Saint Mary River drainage, including Saint Mary Lake and Upper Waterton Lake in Glacier National Park. Other populations, including Echo (near Big Fork), Flathead and Whitefish lakes, and Fresno and Fort Peck reservoirs, have been established through stocking and subsequent dispersal.

Though lake whitefish are a high quality sport fish (typically 18 – 22 inches; state record: 10 lbs), their limited distribution and often poor catchability result in only about 0.1% of the total fishing days in Montana spent pursuing the species. Flathead Lake provides the bulk of angling pressure for lake whitefish in Montana, through catch rates for this summer fishery can vary substantially year-to-year. Anglers also target lake whitefish through the ice on Echo and Whitefish lakes, during fall spawning migrations on the Flathead River near Kalispell, and spring through autumn in the Milk River tailwater below Fresno Reservoir.

Mountain whitefish (native)

The mountain whitefish (*Prosopium williamsoni*) is a common native species in relatively cold streams, rivers, lakes and reservoirs in the western half of Montana, including the Columbia, Missouri, Saskatchewan and Yellowstone basins. Mountain whitefish are abundant in many larger rivers and are commonly captured by anglers who are targeting trout (less than 1% of total angler days are spent directly pursuing the species). Typical adult mountain whitefish are 12 –16 inches in length and the state angling record is 5 lbs (Hauser Reservoir).

Although mountain whitefish remain present throughout their historic range in Montana, there are concerns of potential reductions in abundance in some locations (e.g., Madison River). Owing to their typically high abundances and active movement, mountain whitefish populations have not been historically monitored in rivers and population trends are generally not well documented. Cause of possible declines in some locations are currently only speculative, but may include disease (e.g. whirling disease), drought, or other habitat changes. FWP is developing monitoring protocols that will help to better understand current mountain whitefish status and future trends in abundance. Likewise, research efforts are underway to better understand the ecology of the species including its habitat needs, movements and possible cause(s) of apparent declines in some waters. Despite some concerns, mountain whitefish remain one of the most widespread and abundant sport fish in Montana. The bag limit was reduced to 20 daily and 40 in possession (down from 100 daily and in possession) in 2008 as a result of concerns over their diminishing abundance.

Nongame fish (native)

Montana waters are home to 39 native species that are considered “non-game” fish. Many of these are small minnow species that occupy a wide diversity of habitats throughout the state and include such common fish as long-nose dace and fathead minnows. The group includes several sucker and sculpin species that are common and well known to most anglers, and eight Montana Species of Concern that can be quite rare including the blue sucker, northern redbelly x finescale dace, pearl dace, shortnose gar, sicklefin chub, spoonhead sculpin, sturgeon chub, torrent sculpin and the trout-perch. Native non-game fish range in size from the two inch sand shiner to the bigmouth buffalo that can reach three feet in length. Although many anglers would classify native nongame fish as “bait fish,” the group also includes predators like northern pikeminnow and shortnose gar.

The term “non-game fish” simply refers to the fact that the species have not been classified in Montana statute as “sport” fish (there are some sport fish, e.g., bluegills, that are not classified as game fish). Native non-game fish play essential ecological roles in Montana’s streams, rivers, lakes and reservoirs, and as forage fish their presence adds stability and quality to recreational fisheries. Non-game fish are managed as part of larger fish assemblages where quality fisheries and species abundance are maintained through habitat protection and restoration, and predator-prey management.

FWP is giving greater management attention to several non-game Species of Concern, and recent studies have evaluated the status of sculpin species, as well as prairie stream fish assemblages including pearl dace and redbelly x finescale dace. Many prairie streams in the Eastern District have fish assemblages largely comprised of nongame/native fish which are adapted to intermittent and ephemeral stream conditions. Expanding oil and gas development in the Bakken and Powder River areas come with water demands, and as such the FWP is devoting more attention to monitoring the viability of these fish populations.

Northern pike (native to the Saskatchewan drainage, non-native elsewhere)

Northern pike (*Esox lucius*) is the second largest species in the family Esocidae (behind only the muskellunge, *E. masquinongy*) and has the broadest distribution of any fish in that family. Its native range extends around the globe in the northern hemisphere in North America, the United

Kingdom, Europe and Asia. Throughout its native range the northern pike has tremendous commercial, recreational and cultural importance.

Northern pike reach sexual maturity as early as age 1 for males and 2 for females, though most spawning aged fish are usually between 3 and 4. Spawning occurs in spring as water temperature exceeds 42° to 50° F, which may occur as early as March and even under the ice in some areas. Adhesive eggs are laid on emergent macrophytes, and hatching may occur rapidly (as early as a few days). After hatching, young northern pike feed on small invertebrates and their cohorts. When their body length is 2-4" they start feeding on small fish almost exclusively. Northern pike are typically ambush predators; they lie in wait for prey for long periods and then rapidly swim forward to strike prey. However, in the winter and late-summer, they will feed in the open-water (pelagic) zone of lakes.

Northern pike are primarily piscivorous (fish-eaters) though they have been known to take rodents and even ducklings. The popularity of northern pike as a sport fish stems from their ability to attain large sizes, the relative ease in catching them, and they are considered good table fare. The Montana state record is 37.5 lbs from the Tongue River Reservoir. Popular pike fisheries are primarily in reservoirs in the eastern part of the state, including Fort Peck, Tongue River, Tiber, Pishkun and Nelson reservoirs. Northern pike normally live 5 to 15 years, but can be as old as 30.

Because of its popularity as a sport fish and as a food fish, the northern pike has been introduced in many waters outside its native range and its range continues to expand through introductions (both illegal and authorized) to this day. In Montana, northern pike are only native to the upper Saskatchewan River drainage in extreme north-central Montana. The first northern pike scientifically documented in Montana was collected in 1874 from the St Mary River.

In the Columbia River drainage (to which the Clark Fork is a primary tributary) northern pike are not native and share no evolutionary history with fish fauna. As a result, prey species (sucker, minnows, and salmonids) are naïve to this predator. Within their native range, fish have evolved behavioral, chemical, and physical defenses, including sharp and stiff fin rays. When given a choice, northern pike will consume soft-rayed fishes. Northern pike are thus able to quickly exploit these prey. Furthermore, northern pike have no natural predators in these systems.

In general, outside of trout waters, northern pike are managed as a sport fish. Within trout waters (both east and west of the continental divide) the management goal is suppression, to limit increase in distribution, limit new populations, and even eradication in certain instances. Even outside of trout waters, recent concern over competition with sauger and their effects on native fishes in prairie streams has led to more monitoring.

In the Western Fishing District (west of the continental divide) regulations are generally structured to allow for liberal harvest of northern pike as an unwanted fish. In the Clark Fork and Blackfoot drainages, regulations allow unlimited harvest and opportunities for spearing, while in the Flathead and Lower Clark Fork drainages, management reverts to district wide standards (15 fish daily and in possession) with some extended seasons to allow harvest during the winter in waters otherwise closed to winter fishing. In the Central and Eastern fishing districts, standard

regulations allow for 10 northern pike daily and in possession. However, in the Missouri, Madison, Gallatin and Jefferson drainages, concern over the potential deleterious effects of feral, illegally-introduced northern pike on salmonids in particular, has led to more liberal harvest (no limits) and extended seasons. Aggressive management actions are currently being explored and undertaken on Toston Reservoir to limit northern pike at the headwaters of the Missouri River.

Paddlefish (native)

Paddlefish (*Polyodon spatula*) are an ancient, cartilaginous (not bony) fish and one of only two paddlefish species worldwide. They are also Montana's largest native fish with the state record being 77 inches in length and weighing 143 pounds. A more typical size for a harvested fish is between 20 and 100 pounds. This species was quite uncommon prior to the completion of Fort Peck Dam and Garrison Dam in North Dakota. Its abundance has increased markedly in the past 50 years due to the fact that the fry survive much better in the still water of reservoirs compared to the swift water of rivers. This is probably because the primary food for this species (zooplankton) is more abundant in reservoirs than rivers. The species is long lived, with older fish commonly reaching 50-60 years old. Current distribution of the fish in Montana is the Missouri, Milk, Marias and Yellowstone rivers. In the Missouri River they are found downstream of the Great Falls. Yellowstone River distribution is typically downstream of the Intake Diversion near Glendive; in high water years fish may use a side channel around the diversion and ascend the river as far as the Cartersville Diversion near Forsyth.

The fish are managed as two naturally-reproducing stocks: the Yellowstone River and Missouri below Fort Peck Dam, and the Missouri River above Fort Peck Dam. The Yellowstone stock is managed cooperatively through a joint management plan with the State of North Dakota. Harvest of this recreational fishery is accomplished by snagging, and targets for each stock are set on an annual basis. Since 2010 the target has been 1,000 fish for the Yellowstone/lower Missouri and 500 fish for the Missouri upstream of Fort Peck Reservoir. The harvest is closely monitored by biologists and creel clerks and can be closed immediately or with 24 hours notice, depending on the location. One unique aspect of the Yellowstone fishery is the presence of a caviar operation, which is run by the Glendive Chamber of Commerce. Proceeds from this operation are divided between the City of Glendive and FWP, with the State's share going to help fund research and management activities for the species.

The population and demographics of each stock is re-calculated annually for the purpose of evaluating the sustainability of the harvest. Details of the management goals and activities can be found in the Interstate Management plan "*Management Plan for Montana and North Dakota Paddlefish Stocks and Fisheries (2008)*."

Sauger (native; Montana Species of Concern)

The sauger (*Sander canadensis*) is a member of the perch family and a native game species in the Missouri and Yellowstone basins of Montana. Their historic distribution includes the Missouri River and its major tributaries downstream of Great Falls, and the Yellowstone River and its major tributaries downstream of the Clark's Fork River near Billings. Sauger prefer turbid and unimpeded rivers which permit spawning migrations of up to several hundred miles. Sauger also occupy reservoirs with suitable habitat, and several in Montana support sizable populations (e.g., Yellowtail and Fort Peck). Sauger have become rare or absent in a number of larger rivers

in Montana (e.g., Judith, Poplar, Big Horn and Tongue rivers), due in part to dams, diversions and impoundments that have altered temperature, flow regime and favored river habitats, and obstruct migrations. Additional management concerns include entrainment in irrigation canals, streambank alterations, and competition or hybridization with non-native species (e.g., smallmouth bass and walleye). Though it remains widely distributed in Missouri and Yellowstone rivers, and is common in some locations, the sauger is listed as a Montana Species of Concern owing to an estimated 50% reduction in distribution and widespread threats. The sauger has received considerable management attention since reductions in abundance were first noted in the drought years in the 1980's. Several studies have since been completed to better understand the species overall status, habitat needs, movement patterns and threats. These assessments have provided important information on the impact of habitat alteration on sauger and other prairie river species (e.g., blue sucker, sturgeon and paddlefish), and recent restoration efforts have been directed towards reducing entrainment in irrigation canals, and promoting movement in the Tongue River through construction of a by-pass channel around an irrigation dam. Modifying dam operations to promote more natural hydrographs and temperatures on mainstem and tributary rivers will continue to be important but difficult issue to address. Hybridization between sauger and non-native walleye is also a concern, and the issue is being addressed in the Bighorn River system through stocking of sterile walleye in Yellowtail Reservoir.

On larger rivers spring and fall aggregations of sauger provide for popular fisheries, though overall, less than 0.2% of statewide angling pressure is targeted towards the species. Standard angling limits for sauger are 5 daily and 10 in possession, though to protect some populations from the potential stress of over-harvest, in many locations limits are reduced to 1 daily and 2 in possession. A draft version of a sauger conservation agreement was produced by FWP in 2004 (*Memorandum of Understanding and Conservation Agreement for Sauger (Sander canadensis) in Montana*) with the goal of enlisting the support and assistance from other agency partners to conserve this species.

Sturgeon: Pallid sturgeon (native; federal ESA endangered species; Montana Species of Concern)

The historic distribution of pallid sturgeon in Montana includes the Missouri River below the mouth of the Marias River, the lower reaches of the Milk River, and the Yellowstone River below the mouth of the Tongue River. Pallid sturgeon are long-lived (50+ years), highly migratory, and require large, turbid, relatively warm, and free-flowing rivers to successfully reproduce. The construction of dams and corresponding impoundments on the upper Missouri River beginning in the early 1900's, (e.g., Canyon Ferry and Fort Peck reservoirs, and North Dakota's Lake Sakakawea), Yellowstone River (e.g., Intake Diversion Dam), and associated dammed tributaries (e.g., Yellowtail, Tongue and Tiber reservoirs on the Bighorn, Tongue and Marias rivers) have impeded successful spawning and recruitment of pallid sturgeon in Montana. Dams and impoundments block migration routes, alter natural spawning cues such as discharge, temperature and turbidity, fragment populations (i.e., above Fort Peck Reservoir), and alter habitats necessary for survival of fry. It is currently estimated that fewer than 120 adult pallid sturgeon persist in the upper Missouri and Yellowstone rivers above Lake Sakakawea. The pallid sturgeon was listed as a federal endangered species in 1990, and is a Montana Species of Concern. Angling for pallid sturgeon is not allowed in Montana.

Management plans and conservation efforts for pallid sturgeon are developed and implemented through a USFWS-coordinated Recovery Team that includes state- and federally-appointed staff. Short-term management objectives for the species include preventing local extirpation through population supplementation with hatchery-propagated fish, providing adult upstream passage at Intake Diversion Dam on the Yellowstone River, and developing strategies to address impacts to spawning and recruitment related to Fort Peck and Sakakawea reservoirs. Long-term and natural persistence of pallid sturgeon will require changes to reservoir operations that result in re-establishment of spawning cues and habitats necessary for fry survival.

Though pallid sturgeon will likely remain a federally listed and managed species for the foreseeable future, FWP will remain active participants in the development, promotion and implementation of conservation efforts that result in recovery and de-listing of the species.

Relevant management documents: *Pallid Sturgeon Recovery Plan* (USFWS, 1993); *Biological Opinion on the Operation of the Missouri River Main Stem Reservoir System, Operation and Maintenance of the Missouri River bank Stabilization and Navigation Project, and Operation of the Kansas River Reservoir System* (USFWS, 2000); *Biological Opinion for the Operation and Maintenance of the 9-foot Navigation Channel on the Upper Mississippi System* (USFWS, 2000); *Pallid Sturgeon Range-wide Stocking and Augmentation Plan* (USFWS, 2006); *Memorandum of Understanding for Upper Basin Pallid Sturgeon Recovery Implementation* (Upper Basin Workgroup, 2008)

Sturgeon: Shovelnose sturgeon (native)

The shovelnose sturgeon (*Scaphirhynchus platyrhynchus*) is native to Montana with a current distribution that includes the Missouri River below Morony Dam near Great Falls, the Marias River below Tiber Dam, the Yellowstone River downstream of Cartersville Diversion Dam at Forsyth, and the lower reaches of the Milk, Powder, Tongue and Teton rivers. Shovelnose are also present in Bighorn, Fort Peck and Tiber reservoirs. Shovelnose and pallid sturgeon coexist in portions of the Missouri and Yellowstone rivers; but unlike their *endangered* cousin, shovelnose are less impacted by dams and impoundments and remain common to abundant in many locations. Like many prairie river fish species however, impediments to movement, entrainment in irrigation canals, and altered flow and temperature regimes have resulted in reduced distribution and abundance of shovelnose sturgeon in portions of their range, particularly tributaries to the major rivers. On-going efforts to address these issues will benefit shovelnose sturgeon as well as many other game and non-game species. Furthermore, the Pallid Sturgeon Recovery Team has supplemented the adult pallid sturgeon population with hatchery-propagated fish from 2000-2012. The densities of juvenile pallid sturgeon are reaching levels that shovelnose sturgeon anglers are beginning to catch hatchery released pallid sturgeon. The “Similarity of Appearance” provision needs to be watched closely by FWP since juvenile pallid sturgeon are the same size and similar in appearance to shovelnose sturgeon. Educational efforts to aid anglers with sturgeon identification, to eliminate accidental harvest, needs to be an increased component for FWP and the pallid sturgeon program.

Though they remain common in many portions of their range, including in Montana, shovelnose sturgeon are treated as a federally *threatened* species under “Similarity of Appearance” provision

of the Endangered Species Act (ESA). This provision has been applied to shovelnose to protect *endangered* pallid sturgeon from inadvertent commercial “take” in areas where the species’ range overlap. The ESA listing of shovelnose only applies to commercial activities, and while both species occupy the Missouri and Yellowstone rivers in Montana, recreational fishing is not impacted by the rule. Accidental angler harvest of pallid sturgeon is a concern in Montana, and to address the issue, fishing regulations require release of *all* sturgeon greater than 40 inches. The basis of this regulation is that pallid sturgeon adults are typically greater than 40 inches, while shovelnose sturgeon rarely reach that length. Furthermore, the Pallid Sturgeon Recovery Team has supplemented the adult pallid sturgeon population with hatchery-propagated fish from 2000-2012. The densities of juvenile pallid sturgeon are reaching levels that shovelnose sturgeon anglers are beginning to catch hatchery released pallid sturgeon. The “Similarity of Appearance” provision needs to be watched closely by FWP since juvenile pallid sturgeon are the same size and similar in appearance to shovelnose sturgeon. Educational efforts to aid anglers with sturgeon identification, to eliminate accidental harvest, needs to be an increased component for FWP and the pallid sturgeon program.

Even though shovelnose sturgeon can reach more than 3 feet of length and 5 – 10 pounds, and are considered high quality table-fare, few Montana anglers specifically target the species and they account for only about 0.03% of the annual angler days in the state. An exception is the lower Marias River where a popular late spring fishery exists for adult shovelnose migrating from the Missouri River. Shovelnose are also occasionally captured by anglers targeting other species, particularly catfish. Central and Eastern district harvest limits for shovelnose sturgeon are 5 daily and in possession, with an exception being Bighorn Lake where the harvest limit is two daily and in possession. As previously noted, all sturgeon greater than 40 inches in length must be released.

Shovelnose sturgeon may be vulnerable to over exploitation as a result of their low recruitment. Surveys on the Middle Missouri River from 2007 – 2011 indicated a moderate harvest of shovelnose sturgeon with similar catch rates in 2007 and 2011, but the proportion of sturgeon that were caught and harvested was relatively high at 62% in 2007 and 65% in 2011. Total harvest could easily surpass 2,000 adult fish per year when total fishing pressure is factored in. Further study is needed to determine what harvest level will keep this high quality population at its present level.

Sturgeon: White sturgeon (native; federal ESA endangered species; Montana Species of Concern)

The historic range of the landlocked population of Kootenai River white sturgeon includes approximately 168 river miles of the river from Kootenai Falls downstream through Idaho and into Kootenay Lake in British Columbia, Canada. Corra Linn and Duncan dams in British Columbia (completed in the 1930’s and 1960’s), Libby Dam in Montana (1970’s) and levee construction in Idaho significantly reduced the quality and availability of sturgeon spawning and rearing habitat, resulting in very limited natural recruitment and a declining population of wild fish. Current estimates indicate fewer than 1,000 wild, adult white sturgeon remain in the population, and very few occupy their historic range in Montana. The Kootenai white sturgeon was listed as an endangered species under ESA in 1994 and is a Montana Species of Concern. Angling for white sturgeon has not been allowed in Montana since 1979.

Management plans and conservation efforts for Kootenai River white sturgeon are developed and implemented through a USFWS-coordinated Recovery Team composed of state, federal, tribal and Canadian appointments. Short-term recovery objectives for the species include reestablishing successful natural recruitment and preventing extinction through population supplementation. Ultimately, the Kootenai white sturgeon population could be delisted if the population becomes naturally self-sustaining, a process that could take decades to realize because sturgeon do not become reproductively mature until about 30 years of age. The USFWS recovery plan (1999) for the Kootenai River Population of white sturgeon details management activities including release of hatchery sturgeon propagated in Idaho and British Columbia, manipulation of dam discharges and water temperature, and habitat restoration to improve spawning and rearing.

Though Kootenai River white sturgeon will likely remain a federally listed and managed species for the foreseeable future, FWP will remain active participants in the development, promotion and implementation of conservation efforts that result in recovery and de-listing of the species.

Relevant management documents: *Recovery Plan for the Kootenai River Population* (USFWS, 1999); *Critical Habitat Revised Designation for the Kootenai River Population of White Sturgeon (Acipenser transmontanus): Final* (USFWS, 2008); *Biological Opinion on the Effects of the Federal Columbia River Power System on Five Endangered or Threatened Species* (USFWS, 1995); *Biological Opinion on the Effects to Listed Species from Operations of the Federal Columbia River Power System* (USFWS, 2000). *Fish and Wildlife Service Biological Opinion Regarding the Effects of Libby Dam Operations on the Kootenai River White Sturgeon, Bull Trout, and Kootenai Sturgeon Critical Habitat* (USFWS, 2006). *Clarification of the 2006 Fish and Wildlife Service Biological Opinion Regarding the Effects of Libby Dam Operations on the Kootenai River White Sturgeon, Bull Trout, and Kootenai Sturgeon Critical Habitat* (USFWS, 2008).

Trout: Brook trout, brown trout, lake trout, rainbow trout, golden trout (non-native)

Since their introduction to Montana starting in the late 1800's, rainbow trout (*Oncorhynchus mykiss*), brown trout (*Salmo trutta*), brook trout (*Salvelinus fontinalis*), golden trout (*Oncorhynchus mykiss aquabonita*) and lake trout (*Salvelinus namaycush*) have become the most common and widely dispersed fish assemblage in the state. Also referred to as "non-native trout," the origins of these species are as far away as Europe (brown trout). They have proven to be highly successful in Montana and they thrive in the traditional cold-water trout habitats in the western half of the state and in the historically warmer and turbid eastern waters where suitable trout habitats now exist, primarily in dam tailwaters as a result of reservoir construction.

Almost three quarters of all anglers in Montana identify trout as their target fish species. Much of this fishing is for rainbow trout, which exist throughout all cold water habitats in Montana, but primarily in rivers, stream, lakes and lowland reservoirs. Brown trout occupy similar habitat to rainbows although are slightly more tolerant of warmer water and less tolerant of large reservoirs. Brook trout do best in smaller rivers, streams, spring creeks and mountain lakes. Lake trout do best in deep lakes and reservoirs, although it is important to note that there are two lakes with native lake trout in southwest Montana that are apparently relicts from the time of the last

glacial age. Finally, several dozen mountain lakes, primarily in southwest Montana, support unique golden trout fisheries that are self-sustaining or periodically supplemented with hatchery produced fish.

Management of non-native species of trout varies greatly by species, body of water, and management objectives. Since the 1970's, "wild trout" management has been a priority in Montana rivers and streams. The fundamental elements of wild trout management are to maintain populations through natural reproduction (i.e., no hatchery stocking) and the protection or restoration of high quality habitat. This management philosophy has been extremely successful and several rivers in Montana are among the most popular trout fisheries in the nation.

Harvest regulations for introduced trout in streams and rivers are based on both biological and social issues. More stringent regulations such as "catch-and-release only" are used to maintain satisfactory trout densities in heavily fished reaches of some rivers. Regulations that limit the harvest of larger fish are also commonly used to help maintain trophy fisheries and sufficient number of reproducing adults. More liberalized harvest regulations are generally applied towards brook trout, which are very common in many smaller streams, and lake trout where their potential impacts on native species is a concern (e.g., Flathead River drainage).

Lake and reservoir trout fisheries are also managed on an individual basis for a variety of objectives (e.g., put-grow-take, trophy, self-sustaining). In most cases harvest is generally less restricted (more liberal opportunities to harvest fish) compared streams and rivers. Rainbow trout provide the bulk of introduced trout fishing opportunities on many lakes and reservoirs and many of these fisheries are supported by hatchery efforts. Other introduced trout fisheries are generally self-sustaining through natural reproduction. Like regulations for streams and rivers, liberal harvest limits for brook trout are standard in mountain lakes to reduce issues of over abundance (e.g., stunted populations resulting in small fish size). Angler harvest of lake trout is encouraged in Flathead and Whitefish lakes to aid conservation of native bull and westslope cutthroat trout. Lake trout are uncommon in the central and eastern fishing districts (i.e., primarily Tiber and Fort Peck reservoirs) and limits are relatively restrictive. Georgetown Lake provides a unique trophy brook trout fishery and is an exception to typical liberal limits for the species. Finally, brown trout are generally managed under the combined trout limits for lakes and reservoirs, and are often a part of mixed fisheries with rainbow trout. The predatory nature of brown trout allows them to reach a relatively large size (5 – 10 lbs) in many waters, and though not commonly caught, these large fish occasionally provide anglers targeting other species with an unexpected trophy catch.

Trout: Bull trout (native; federal ESA threatened species; Montana Species of Concern)

Bull trout (*Salvelinus confluentus*) are native to rivers, streams and lakes in the Columbia River basin (Kootenai, Clark Fork, Bitterroot, Blackfoot, Flathead, and Swan drainages) and Saskatchewan River basin (St. Mary and Belly drainages) in Montana. Bull trout are actually a char and display a variety of life-histories strategies. Populations that reside entirely in small streams are classified as "resident" and rarely reach 12 inches in length. More common and well known are migratory bull trout populations (e.g., Flathead Lake and river system, and the Blackfoot River drainage) that use a combination of lakes, reservoirs (adfluvial) or large rivers

(fluvial) as adults, and small streams for spawning and juvenile rearing. Migratory bull trout are the largest native salmonid in Montana and adults exceeding 10 lbs are common in these populations. The state record fish is over 25 lbs. For successful spawning, bull trout require near pristine habitat conditions, particularly cold headwater streams with clean gravel bottoms and connectivity.

While bull trout remain widespread in Montana, significant declines in abundance have been observed in most populations. Major causes for these declines include changes in habitat that reduce spawning success, barriers that prevent movement of migratory fish, and non-native fish (e.g. lake and brown trout) that prey on or compete and hybridize (e.g., brook trout) with bull trout. Bull trout in the South Fork of the Flathead, above Hungry Horse Reservoir, remain a protected and robust population. Bull trout are a Montana Species of Concern and were listed as a "threatened" species by the USFWS in 1998.

Because bull trout are a federally listed species, FWP and numerous state, federal and private partners are active participants in their management and conservation. Habitat protection and restoration, and restoration of migratory corridors (e.g., removal of barriers to movement) are among key elements to bull trout conservation and recovery. The large-scale habitat restoration program in the Blackfoot Valley and the removal of Milltown Dam are notable examples of these types of efforts. The presence of predatory nonnative fish, particularly lake trout, northern pike and walleye, are significant but difficult threats to address. An on-going experimental lake trout removal effort in Swan Lake has been implemented to not only aid in the conservation Swan drainage bull trout, but also to determine whether suppression of nonnative species in certain locations can assist in bull trout recovery. Angling and harvest is closely regulated to prevent additional stress on bull trout populations. Currently (2012), intentional angling for bull trout is prohibited everywhere except in Hungry Horse and Lake Koocanusa reservoirs, Swan Lake, and the South Fork of the Flathead River upstream from Hungry Horse reservoir. At this time, Hungry Horse Reservoir is the only place in the state where a limited bull trout harvest is allowed.

Management of bull trout is guided by both state and federal documents. In 2000, a State of Montana sponsored effort with multiple stakeholders produced the planning document titled *Restoration Plan for Bull Trout in the Clark Fork River Basin and Kootenai River Basin in Montana*. This plan sets goals, objectives and criteria for bull trout restoration, outlines actions to meet those criteria, and establishes a structure to monitor implementation and evaluate effectiveness of the plan. Local plans provide direct guidance for local bull trout conservation efforts and include such documents as *An Integrated Stream Restoration and Native Fish Conservation Strategy for the Blackfoot River Basin* (FWP 2005), and *Flathead Lake and River Co-Management Plan, 2001 – 2010* (FWP and Confederated Salish and Kootenai Tribes 2001). As a listed species, the USFWS is responsible for developing federal bull trout recovery plans and designation of "critical habitats." Although critical bull trout habitat in Montana was designated in 2010, the recovery plan is still in draft stage and has yet to be finalized.

Trout: Redband trout (native; Montana Species of Concern)

Redband trout (*Oncorhynchus mykiss gairdneri*) are a subspecies of rainbow trout native to the Kootenai River drainage in northwest Montana. Historically redband trout were common in the

Kootenai River and associated tributaries downstream of what is believed to have been a natural barrier near the present-day Libby Dam (near Libby, MT). Owing to habitat changes and competition and hybridization with non-native trout (e.g., brook trout and coastal rainbow trout), the subspecies has declined in abundance and distribution and is presently restricted to headwater streams, or streams with barriers that prevent invasion of nonnative trout. It is estimated that redband trout (> 90% genetic purity) currently occupy about 41% (306 miles) of their historic range in Montana. Due to this reduced distribution, and threats to many remaining populations, redband trout have been listed as a Species of Concern in Montana.

FWP and land managers (State, federal and private) are integral partners in the management of redband trout. Current management efforts include assessing and monitoring remaining populations; protecting important habitats; and developing long-term conservation strategies that may include removal of non-native trout and placement of barriers to prevent their return, and reintroduction of redband trout to streams where they have been lost. In addition, since 2002 FWP has been developing and testing a redband trout broodstock at FWP's Libby Isolation Facility and Murray Springs State Fish Hatchery. Established from a wild redband population, this brood is being developed to replace the stocking, for recreational purposes, of hatchery coastal rainbow trout or westslope cutthroat trout, in drainages where redband trout are native. The effort will reduce the likelihood of additional hybridization of the species.

In the near term, the management direction for redband trout includes maintaining the existing distribution and genetic diversity of remaining populations, and developing conservation plans and projects that ensure long-term, self-sustaining persistence of the subspecies in Montana. Though recreational angling opportunities for the redband trout are currently limited outside of small streams, the development of a redband trout brood stock should provide future opportunities to establish recreational fisheries in closed-basin lakes in the Kootenai drainage. Likewise, efforts to secure and expand the distribution of existing populations and reintroduce them into streams where they have been lost will result in additional opportunities to pursue this unique native sport fish. Currently, FWP is in the process of developing a Redband Trout Management Plan.

Trout: Westslope and Yellowstone cutthroat trout (native; Montana Species of Concern)

Two sub-species of cutthroat trout are native to Montana: Westslope cutthroat trout (*Oncorhynchus clarki lewisi*) and Yellowstone cutthroat trout (*Oncorhynchus clarki bouvieri*). Together they share the distinction as "Montana's State Fish." Westslope cutthroat trout (WCT) are native to the Clark Fork, Kootenai, Missouri (above and including the Judith) and St. Mary drainages. Yellowstone cutthroat trout (YCT) are native to the Yellowstone River and associated tributaries above the mouth of the Big Horn River.

Historically WCT and YCT occupied all accessible, cold water streams and lakes in their respective drainages, and resident (stream occupant), fluvial (migratory river fish) and adfluvial (migratory lake fish) forms were present. While WCT remain common in many waters west of the continental divide, and both WCT and YCT have been stocked in numerous lakes and reservoirs, their distribution and abundance has declined in many portions of their historic range. Major factors contributing to the sub-species' decline include competition with non-native

species of trout (brook, brown and rainbow trout), hybridization with rainbow and YCT or WCT that were stocked outside their historic range, habitat changes and migratory barriers. In Montana it is currently estimated that genetically pure WCT occupy about 20% (5,950 miles) of their historic range and genetically pure YCT occupy about 16% (705 miles) of their historic range. Slightly hybridized populations (<10% level of hybridization) are also managed for their conservation value and when combined with genetically pure population, the current distribution of WCT and YCT increases to 30% (8,830 miles) and 28% (1,210 miles) of their respective historic ranges.

Owing to significant declines in WCT and YCT, each is listed as a Montana Species of Concern. In addition, WCT and YCT were petitioned for listing under the federal Endangered Species Act but these petitions were found “not warranted.”

As a Species of Concern and sport fish, WCT and YCT receive considerable management attention and resources from FWP, federal land management agencies, and private organizations. Though notable exceptions exist (e.g., Flathead Lake), cutthroat-occupied lakes and reservoirs are generally managed as recreational fisheries where harvest is allowed (standard cutthroat trout limits), and if necessary, are periodically stocked with progeny from FWP’s cutthroat broods maintained at Washoe Park Trout Hatchery (WCT; Anaconda, MT) and the Yellowstone River Trout Hatchery (YCT; Big Timber, MT). In most cases WCT and YCT populations residing in rivers and streams have been identified as “conservation populations,” which indicates the need to manage the population for natural, self-sustaining persistence. Streams and rivers are not stocked with hatchery WCT or YCT, with the exception being restoration efforts where cutthroat brood or wild eggs are introduced in smaller streams to reestablish populations. Stream and river creel regulations vary based on strength of populations, with “catch and release” or limited harvest with size limits the most common types of regulation.

Management concerns for WCT and YCT vary by drainage and region of the state. Efforts to address specific threats are often developed specific to an individual body of water. In some waters angler harvest limits and habitat protection are suitable management measures to ensure robust WCT and YCT populations remain. In all locations, biologists are actively monitoring and maintaining or improving habitat conditions necessary for robust cutthroat populations. Such efforts may include addressing concerns related to riparian condition, passage concerns at road crossings, entrainment in irrigation systems, and in-stream flow. In some drainages, non-native trout species are removed to reduce threats to “at-risk” populations, or to develop areas for cutthroat restoration. Barriers to upstream fish passage are often constructed at the lower end of these recovery areas to prevent re-invasion of non-native species. Projects to reestablish WCT and YCT populations for conservation purposes are common in the upper Missouri and Yellowstone drainages, and these efforts often include transferring eggs or live fish from existing threatened populations to preserve their genetic legacy.

Management of Montana’s two cutthroat species is directed by regional and statewide management plans. The 2007 document titled “*Memorandum and Conservation Agreement for Westslope Cutthroat Trout and Yellowstone Cutthroat Trout in Montana*” (MOU; FWP 2007) is the principal document that sets objectives and goals for overall cutthroat conservation in Montana, and has been signed by numerous state, federal, tribal, and private stakeholders.

Walleye (non-native)

Walleye (*Sander vitreus*) is a non-native species which is found widely in lakes, reservoirs and large rivers in Montana east of the Continental Divide. It is also found west of the Continental Divide in Noxon Rapids Reservoir, apparently a result of an unauthorized (illegal) introduction. Its range and abundance has increased in recent years in the Missouri River between Holter Dam and Great Falls, as well as in the Yellowstone River downstream of the Ranchers Diversion near Bighorn.

Walleye have achieved an avid following among anglers in Montana. According to the 2009 Statewide Angler Survey, over 7% of angler days in Montana were spent in pursuit of this species. Walleye are considered by many anglers to be a handsome fish with excellent flavor, and they also achieve impressive size when their forage is abundant. The current record is 17.75 pounds from Tiber Reservoir.

Because walleye require rock, rubble or gravel substrates for successful spawning, natural reproduction is better at some lakes such as Canyon Ferry and Tiber reservoirs, while worse at others such as Fort Peck, Hauser and Nelson reservoirs where fine sediments will smother eggs and reduce the successful hatch. In reservoirs, dam operations can be detrimental if water levels are dropping during spawning and incubation. Recruitment is also highly influenced by favorable weather conditions in the spring, probably more so than by the number of spawners present or the number of eggs laid. Walleye forage (small fish) is also influenced greatly by reservoir levels. Water levels rising during the time of forage spawning in the spring, combined with the availability of vegetation for spawning and cover, will also greatly influence forage success.

FWP stocks walleye as fry or fingerlings in reservoirs where habitat and/or dam operations limit natural production. Most of the hatchery capacity and staff at Fort Peck and Miles City hatcheries are devoted to collecting walleye spawn, hatching the eggs, and growing fish to a stockable size. Between 2000 and 2010, FWP stocked approximately 329 million fry and 27 million fingerlings into Montana reservoirs, with the bulk of them going to Fort Peck Reservoir. FWP Policy currently prohibits the stocking of walleye west of the Continental Divide

Walleye will hybridize with sauger, a native Species of Concern, and a recent study found the highest rates of walleye x sauger crosses in the lower Yellowstone River. There is little evidence of the hybrids mating with each other or with either of the pure species, suggesting that the hybrids are sterile or less fit than the parent species. Studies are ongoing to further understand the impacts of this hybridization on sauger populations. To avoid impacts of hybridization, FWP has begun to stock triploid (sterile) walleye into some systems. At the time of this writing, Bighorn Lake has received triploids for the past three years and other reservoirs (such as Tongue River Reservoir) may be considered in the future.

Yellow perch (non-native)

Yellow perch are among the most widespread and popular sport fish in Montana. They thrive in ponds, lakes and reservoirs, and are also common in sloughs and slower rivers. Perch were initially introduced to Montana waters more than a century ago, and through stocking efforts, natural dispersal and illegal introductions, are now present in most major drainages of the state. Perch are not propagated in Montana hatcheries for stocking efforts, but are occasionally

transferred between ponds in eastern Montana to reestablish fisheries after periodic winter kills. Perch are an important forage species for predatory sport fish like bass, walleye, sauger, northern pike and burbot, and their presence is a key factor in the quality and stability of many fisheries. High reproductive rates also allow perch to overpopulate some waters, particularly ponds, resulting in poor quality fisheries of small fish and possible impacts to other game species. Unfortunately, perch have also been illegally introduced to numerous waters, resulting in significant changes to some fisheries.

Yellow perch are a highly valued sport fish in Montana, and based on angling days, only trail trout and walleye in statewide popularity. Perch are targeted by anglers in all seasons, and favored fisheries are those where quality fish (> 8 inches) are produced. Perch populations can generally support high levels of angler harvest, and with the exception of reservoirs on the upper Missouri River (Canyon Ferry, Hauser, Lake Helena, and Holter), there are no daily or possession limits. On those reservoirs, the restrictive regulations are in place due to high angler pressure and walleye predation.

FISHERIES HABITAT PROGRAM

Fish Habitat Goals

1. Preserve and protect aquatic habitats.
2. Restore and enhance degraded aquatic habitats
3. Restore and maintain adequate water flow in streams and satisfactory water levels in lakes and reservoirs.

Background and Description

Generally speaking, fish thrive in diverse, healthy aquatic ecosystems. Good fish habitat consists of three essential elements: 1) *water quantity*—adequate water flow in streams throughout the year and satisfactory water levels in lakes and reservoirs to sustain healthy aquatic communities; 2) *water quality*—water of suitable quality for sustaining healthy populations of fish and other aquatic life; and 3) *physical habitat features*—landscape features such as streambeds and banks, riparian areas, and cover that, together, when functioning properly, provide a favorable environment for fish and other aquatic life to carry out all essential phases of their life cycles. All of the above require maintenance of a functioning floodplain, as well as judicious land management practices throughout the watershed, including upland areas.

Compared to the rest of the nation, the aquatic habitat in Montana rivers, streams and lakes is in good condition. As in other parts of the country, however, Montana has some portions of its rivers, streams and lakes where fish habitats have been degraded because of land-management practices and other human activities. Current and projected human uses of the environment have the potential for degrading existing habitats even further. We have the ability, technology, and obligation to protect and restore these habitats wherever possible. To address these needs, the Fisheries Program has established three broad goals and identified a number of activities for reaching each goal.

Instream Flow Protection

The purpose of the Instream Flow Protection program is to physically and legally protect, restore, and manage the instream flows required to sustain Montana's aquatic species, their habitats, and related ecosystems with focus on the increasing competition for the water resources, limited supplies and changing hydrologic conditions. Associated goals include:

1. Restore and maintain adequate water flow in streams and satisfactory water levels in lakes and reservoirs.
2. Provide education and information to the public about the importance of instream flows and lake level protections and the policies used to provide for and protect them.
3. Conduct education and training for FWP staff regarding water measurement data collection and management and flow restoration strategies.

Description of current operations and/or areas of work

Goal 1 is being realized by accomplishing the following objectives:

1. Protecting FWP's existing instream water rights and water reservations through active participation in the water adjudication process and the water right permitting process, and through enforcement of water right priorities;
2. Enhancing stream flow in priority, dewatered streams through water leasing, donations, purchase, market transaction, and other voluntary means;
3. Enhancing reservoir management procedures such that the regulation of water flow in streams and water levels in lakes and reservoirs meets not only the owner's purpose but also benefits, or minimizes impacts to, fish and other aquatic life;
4. Protecting and enhancing stream flows and lake levels in priority areas through collaborative community or watershed groups;
5. Implementing the instream-flow assessment program to validate native and ESA species recovery and obtain additional water reservations on priority streams and rivers; and
6. Acquiring senior water rights or new water reservations to maintain or protect water flow in streams and water levels in lakes or other water bodies.

Goal 2 is being realized by dissemination of information via the FWP website and other forums such as watershed groups. Further information regarding the public understanding of instream flows and lake levels is needed to develop public educational programs.

Goal 3 is being realized by educating staff on water measurement data collection and analysis. Further education regarding flow restoration strategies is needed.

Special issues, challenges or initiatives

The greatest long-term challenge is the ever increasing demand for water in the arid west coupled with increased variability in water supplies. The Water Program will face greater threats to instream flows and lake levels and must be well-positioned to meet this threat by defending FWP's water rights, while also actively working to help develop a strategy that meets the increasing demand and protects instream flows and lake levels.

Applicable laws, rules and policies

Statute (MCA):

Title 85: The Montana Water Use Act governs water reservation, including the defining flow or lake levels, changes in water use that provide for instream flows (both temporary leasing and permanent), the general stream water-right adjudication, and permitting and development of new water rights.

Fisheries Mitigation

State and federal laws and policies were established to mitigate damages to fish and wildlife caused by dams, diversions or mining. Federal and private dams and water diversions control water elevations, flow patterns and environmental conditions (e.g. water temperature, oxygen, water velocity, gas saturation, etc.) needed for fish survival and growth. Dams and diversions often block fish migrations, isolating populations above, below, or between barriers. Fish and wildlife habitat is damaged when reservoirs are drawn down to a fraction of their capacity, and when streams are dewatered, channelized or contaminated. Reservoirs fill with sediments, reducing storage capacity and recreational opportunities. Unnaturally fluctuating river flows cause stream banks to collapse, erode soils, and over-widen stream channels. Streamside vegetation may be left high and dry along many regulated river reaches, inhibiting new seedlings and causing a long-term loss of riparian habitat.

Mitigation programs use applied research to understand limiting factors, and implement on-the-ground actions to perpetuate self-sustaining fisheries, often with emphases on preserving native fish assemblages. Actions taken are designed to maximize system integrity and resilience, and to achieve a variety of specific mitigation goals, including modifying dam operations to restore more natural conditions in impoundments and streams, and improve fish passage to benefit the fisheries upstream and downstream of dams. Where mitigation cannot be accomplished onsite, projects may be implemented in surrounding areas (offsite mitigation). Progress toward mitigation goals is often tracked by first establishing a “loss statement” of habitat and fisheries impacts caused by the disturbance, such as construction and operation of a dam or mine, and then monitoring results as corrective measures are implemented.

Description of current operations and/or areas of work

Water control operations are dictated by potentially conflicting demands for power generation, flood control, navigation, irrigation, and other human concerns. Prior to dam installation, the natural hydrologic cycle (annual hydrograph) in Montana’s rivers included a high spring flow event during snow melt (typically May through June) and a stabilized, low flow period throughout the remainder of the year. Water regulation essentially reversed the natural flow pattern by storing water during spring runoff (to reduce flood risk) and releasing stored water later during the year for other purposes, such as irrigation, power generation, navigation or water supplies. In some cases, river discharges fluctuate unnaturally each day and from one day to the next. Reservoir drawdowns and refill failures impact biological productivity in the reservoirs. Fish and habitat are often damaged when the natural hydrograph is changed.

Fisheries can be improved by designing operating rules for water regulation facilities to optimize potential benefits. Computer models of Hungry Horse, Libby and Yellowtail dams help FWP recommend dam operations that balance fisheries needs in the reservoirs (and rivers downstream) with power generation, flood control and irrigation. A similar model is being developed for Fort Peck reservoir and the Missouri River downstream to examine possible improvements to dam operations. Operating rules limit the duration and frequency of deep reservoir drawdowns, improve reservoir refill, and produce a more natural dam discharge patterns. Fish grow better when reservoirs remain near full pool during the most biologically productive period of the year, summer through fall. At full pool, reservoirs contain the maximum volume of optimal temperature water for forage and fish growth and a large surface area for the

deposition of insects from the surrounding landscape, an important food source for fish during summer and fall. Food availability is reduced when the reservoir surface shrinks and water recedes from shoreline vegetation. Reduced reservoir drawdown protects aquatic food production, ensuring an ample springtime food supply for fish. The shallow areas near shore (littoral zone) are the most productive and, therefore, it is important that they remain wetted during the warm months.

Outflows from dams affect all aquatic life. Fisheries in rivers downstream of the dams can be enhanced by restoring a naturally-shaped flow pattern (hydrograph), including a spring run-off event, followed by gradually declining flows through summer and fall, and reduced flow fluctuation. Minimum flows can be established to support stream life and restore natural floodplain functions. Spring flushing flows sort river gravel, define the channels, and remove tributary deltas, creating a healthy environment for fish and their food supply. Rapid flow reductions are especially damaging for the reason that a large portion of a river can become dewatered, resulting in stranding insects, zooplankton, and potentially fish and fish eggs. It takes over a month and a half for river life to recover after a single low flow event.

Hydropower mitigation projects are underway in the Columbia River headwaters, including the Flathead and Kootenai subbasins. FWP and the Confederated Salish and Kootenai Tribes (CSKT) quantified fish and habitat losses attributable to the construction and operation of Hungry Horse Dam. A similar collaboration with CSKT and the Kootenai Tribe of Idaho (KTOI) documented losses attributable to the construction and operation of Libby Dam. Fisheries Mitigation and Implementation Plans, designed to correct these impacts, were approved by the Northwest Power and Conservation Council (NPCC). The Bonneville Power Administration (BPA) funds mitigation actions to offset fisheries impacts caused by inundation, deep reservoir drawdowns, refill failures, and unnatural flow fluctuations. Mitigation projects address fisheries loss statements for each federal dam, and projects are prioritized within the Flathead and Kootenai Subbasin Plans. Computer models of the reservoirs and rivers were built for the Kootenai and Flathead watersheds to examine the biological responses to various dam operation strategies and implement new operations to balance fisheries needs with flood control, power generation and other water uses.

In the Clark Fork Watershed, mine-related mitigation projects are remediating the harmful effects of mine wastes deposited in the upper Clark Fork Drainage, including removal of the Milltown Dam.

In the Missouri Watershed, FWP collaborated with the US Bureau of Reclamation (BOR) to implement new operating criteria for Yellowtail Dam to benefit fish and recreation in Bighorn Lake reservoir and Bighorn River downstream. There is good potential at Fort Peck Dam to control the water temperature in the dam discharge of by installing a selective withdrawal device. This would make the Missouri River below the dam generally more productive for both native and non-native fish.

FWP also provides recommendations concerning hydropower operations during the Federal Energy Regulatory Commission (FERC) relicensing negotiations, planning efforts and

recommendations concerning activities of agencies other than FWP, comments on environmental documents and additional participation in various environmental stewardship collaborations.

Fisheries mitigation programs must be consistent with FWP's fisheries management objectives and responsive to state constituents, while also complying with all federal, state, tribal, and local laws, and programmatic requirements from a number of external sources. Montana laws commonly followed in fisheries mitigation work include the Montana Environmental Policy Act (MEPA), the Montana Water Quality Act, the Montana Natural Streambed and Land Preservation Act, the Montana Stream Protection Act, the Montana Floodplain and Floodway Management Act, the Montana Streamside Management Zone Law, the Montana Lakeshore Protection Act. All actions using federal funds that might significantly affect the human environment must comply with the National Environmental Policy Act (NEPA), in addition MEPA before implementation. Other federal laws such as the Endangered Species Act (ESA) and Clean Water Act, the Federal Rivers and Harbors Act, and laws represented by the Federal Energy Regulatory Commission may impose additional requirements.

Special issues, challenges or initiatives

Dam operations are modified to recover fish species listed as endangered or threatened under ESA, and to benefit other important fisheries. The endangered Kootenai white sturgeon have prompted operating requirements (sturgeon-tiered flows) at Libby Dam. Seasonal flow restrictions were established at Hungry Horse and Libby dams to benefit threatened bull trout. Operations at Fort Peck dam have been modified to help recover endangered pallid sturgeon. New operating criteria were implemented at Yellowtail Dam to balance elevations in Bighorn Lake reservoir with river flows in the Bighorn River downstream.

The Reserved Water Right Compact Commission has nearly completed negotiating water right compacts with tribes in Montana. The final tribal compact with the Confederated Salish and Kootenai Tribes is currently being negotiated. Water rights associated with the tribal compacts are generally compatible with fisheries mitigation goals and past investments.

Use of external mitigation funding often entails extra negotiations, authorizations, and the reporting and fiscal accountability requirements of the funding source, in addition to the already rigorous requirements of existing state processes. These additional requirements add to the complexity of implementing mitigation programs in Montana. Depending on the source, funding is often earmarked for use in specific areas, or for specific tasks. Constraints on how different funding can be used directly influences program planning. As well as state and federal jurisdictional considerations, mitigation programs frequently involve a wide range of partnerships and collaborations, ranging from individual agreements with private landowners or non-government organizations to full-scale collaborations with Tribal governments. All of these factors add to the unique challenges of implementing fisheries mitigation programs in our state.

Applicable laws, rules and policies

Statute (MCA):

75-1-101 et seq.: Montana Environmental Policy Act. Provides for the adequate review of state actions in order to ensure that environmental attributes are fully considered in enacting laws to fulfill constitutional obligations and to ensure the public is informed of the anticipated impacts in Montana of potential state actions.

75-5-101 et seq.: The Water Quality Act is the primary basis for water quality protection in the state. It provides authority for the surface water and groundwater standards, the mixing zone rules, the nondegradation rules and the subdivision/on-site subsurface water treatment rules.

75-7-101-125: The Natural Streambed and Land Preservation Act intent is to provide adequate remedies for the protection of the environmental life support system from degradation and provide adequate remedies to prevent unreasonable depletion and degradation of natural resources.

87-5-501 9: The Montana Stream Protection Act provides that the fish and wildlife resources and particularly the fishing waters within the state are to be protected and preserved to the end that they be available for all time, without change, in their natural existing state except as may be necessary and appropriate after due consideration of all factors involved.

76-5-101 et seq.: The Montana Floodplain and Floodway Management Act provides the necessary authority to regulate development through adoption of local ordinances designed to minimize flood damage within specific areas identified by the state as prone to flood damage.

77-5-307-7: The Montana Streamside Management Zone Law establishes and maintains a streamside management area along surface waters, which is sufficiently wide and which includes a sufficient number of canopy species to buffer against detrimental changes in the temperature regime of the waterbody to provide bank stability, and to withstand wind damage.

Water Quality Protection

Water quality protection is being realized through collecting relevant information and field data, participating in and influencing decision processes that have implications to water quality, responding to public concerns related to degradation of water quality, and, where possible, facilitating corrective actions.

Description of current operations and/or areas of work

Current operations focus on coordinating FWP efforts related to water quality. This includes: reviewing Montana Pollutant Discharge Elimination System (MPDES) permits; new pesticide registrations, reviewing proposed mine plans; toxicity assessments related to coal bed methane and other extractive types of development; field reviews for forest Best Management Practices (BMP) ; and other actions that have implications to water quality and fish and wildlife. Fisheries staff represents FWP on the Upper Clark Fork River Basin Advisory Council, which is

responsible for facilitating public dialogue, promoting public understanding, and advising the Governor with respect to issues involving remediation and restoration efforts in the basin.

FWP collects (or coordinates collection of) data related to residues of bio-accumulative materials in Montana fishes. This effort includes working with the Department of Health and Human Services (DPHHS) to publish health advisories needed to protect consumers of sport fishes, as well as publishing and updating a fish consumption advisory brochure.

FWP investigates pollution-related fish kills and hazardous-material spills and coordinates with state and federal regulatory agencies on water quality issues. This work includes monitoring superfund activities that have implications to fisheries resources.

Fisheries staff in Helena coordinates with regional staff to identify and solve water quality problems such as providing guidance and monitoring use of fish toxicants for management purposes, e.g., rotenone and antimycin treatments. Staff also provides technical assistance to management biologists on water quality matters.

Special issues, challenges or initiatives

FWP is leading efforts to remediate polychlorinated biphenyl (PCB) contamination in Big Spring Creek near Lewistown. PCBs were discovered in fish in the creek in the early 1980s, and then in sediments in the early 1990s. It wasn't until 2003 that the Big Spring Creek State Fish Hatchery was determined to be the source of this contamination. Paint containing PCBs was applied to the raceways of the hatchery for many years, and over time the paint flaked off and entered Big Spring Creek, contaminating sediments, insects and fish. To protect human health, in 2004 a fish consumption advisory was adopted for the entire creek as was a catch-and-release section on the creek above Lewistown. Cleanup of the hatchery included removing contaminated paint and re-coating the raceways in 2004-2005, followed by replacement of lower hatchery raceways in 2011-2012. Cleanup of the stream began in 2011 and will conclude in 2013, including removal of paint chips through suction dredging in the top six inches of streambed sediments over a 2.8 mile section of stream downstream of the hatchery. These cleanup measures should lead to lower burdens of PCBs in fish flesh and ultimately the removal of fish consumption advisories for the creek. Removal of the catch-and-release regulation would require FWP Commission approval.

Applicable laws, rules and policies

None identified.

Habitat Restoration

Fisheries habitat restoration is accomplished through the initiative of FWP and federal fisheries biologists, non-governmental organizations, and private individuals who identify worthwhile projects and approach funding sources for help in accomplishing them. The key funding source within FWP is the Future Fisheries Improvement Program (FFIP). The Lake and Stream Enhancement and Community Pond programs are also available to fund worthy projects.

Prior to 1989, FWP was only occasionally involved with projects that restore fish habitat. This changed when the 1989 Montana Legislature passed the River Restoration Act. For the first time a portion of fishing-license-dollars was allocated specifically for fish habitat restoration work.

The FFIP, established by the 1995 legislature, incorporated funds from the River Restoration Act and provided an expanded funding source for projects that enhance habitat for wild fish populations in lakes, rivers and streams. The enabling legislation, HB 349, stated: *the department shall fund and implement a program regarding the long-term enhancement of streams and stream-banks, in-stream flows, water leasing, lease or purchase of stored water, and other voluntary programs that deal with wild fish and aquatic habitats.* Over the years, the appropriation of state fishing license dollars available to the program has varied. However, from Fiscal Year 1995 to 2012, \$7.258 million has been earmarked for the Program.

Additionally, the 1999 legislature amended the FFIP to include a category of funding specifically earmarked for bull and cutthroat trout habitat enhancement. HB 647 stated that: *In order to enhance bull trout and cutthroat trout populations through habitat restoration, reductions in species competition, and natural reproduction, the department shall, through its future fisheries improvement program, restore habitats and spawning areas and reduce species competition in rivers, lakes, and streams for Montana's bull trout and cutthroat trout.* Between FY-99 and FY-12, appropriations to the Bull Trout and Cutthroat Trout Enhancement Program have totaled \$6.272 million.

Program funding currently comes from two sources: fishing license dollars earmarked for habitat restoration from the River Restoration Program; and Resource Indemnity Trust (RIT) funds earmarked specifically to the Bull Trout and Cutthroat Trout Enhancement Program.

Potential projects must accomplish one or more of the following goals: improve or maintain fish passage; restore or protect naturally functioning stream channels or banks; restore or protect naturally functioning riparian areas; prevent loss of fish into diversions; restore or protect essential habitats for spawning; enhance stream-flow in dewatered stream reaches to improve fisheries; improve or protect genetically pure native fish populations; and/or improve fishing in a lake or reservoir.

Projects that meet one of the goals listed above are evaluated based on the following criteria: public benefits to wild fisheries; long-term effectiveness; benefits to native fish species; expected benefits relative to cost; in-kind benefits or cost sharing; and importance of the lake or stream.

Description of current operations and/or areas of work

The Future Fisheries Improvement Program accepts proposals for funding of projects twice per year. Proposals are then evaluated by the 14-member citizen-review-panel. The make-up of the review panel is determined by the enabling legislation. Proposals from across the state are due by December 31 and June 30 of each year and the review panel meets in late January and late July, respectively. During each funding cycle, review panel members evaluate proposals, meet with project applicants, and determine which projects to recommend to the FWP Commission for funding. The FWP Commission makes final funding decisions for the Program.

Sponsors of approved projects must enter into a written agreement with FWP. Project funding may only be used for purposes described in the project agreement and the sponsor must ensure that the investment in restoration is protected for a minimum of 20 years.

From the onset of the program, FWP recognized that monitoring was essential to evaluate the success of various restoration treatments and to ensure that program dollars are being spent responsibly. FWP conducts three types of monitoring: implementation, effectiveness and compliance. Virtually all projects sites are reviewed shortly after construction to confirm that the project was completed as proposed. A subset of projects are monitored before, and for several years following, project completion, to determine if the goals of the project are being met. Finally, a subset of projects are monitored every three to five years to ensure land use activities remain in compliance with project agreements.

Special issues, challenges or initiatives

One challenge for the Future Fisheries Program is the lag time between project approval and project completion. Future Fisheries projects are often large, complex, and take several years to complete. Further, most applicants rely on multiple funding sources to cover project expenses. Because applicants need to secure all of their funding prior to initiating project construction, there are often delays as applicants work to secure funding. Additionally, funding is sought for many projects prior to completion of final project plans. Together, these factors often result in a lag between the time funds are committed to projects and the expenditure of committed dollars. Most projects are completed within 1-5 years from the time they are approved.

Applicable laws, rules and policies

Statute (MCA):

87-1-257-259: River Restoration Program – Established a fund using earmarked license dollars and donations and directed FWP to administer a program to implement physical projects to improve rivers and their associated lands in order to conserve fish and wildlife habitat, including but not limited to a change in appropriation right or leasing of water rights.

87-1-272-273: Future Fisheries Improvement Program – Directed FWP to establish and implement a statewide voluntary program that promotes fishery habitats and spawning areas for the rivers, streams and lakes of Montana fisheries, with an emphasis on projects that enhance the historic habitat of native fish species. Re-directed River Restoration Program dollars and temporarily re-directed additional license dollars into the Program; and established a citizen review panel charged with formulating funding recommendations to the FWP Commission.

87-1-283: Bull Trout and Cutthroat Trout Enhancement Program – Directed FWP, through the Future Fisheries Improvement Program, to enhance bull trout and cutthroat trout populations by restoring habitats and spawning areas and reducing species competition in Montana's rivers, lakes and streams, with an emphasis on mine reclamation. Appropriated funding from Montana's Resource Indemnity Trust Fund and temporarily re-directed additional license dollars towards the Program (earmarked specifically for bull trout and cutthroat trout enhancement) and expanded the composition of the citizen review panel.

87-1-274: Emergency In-stream Flow Funding – Directed FWP to use available money from the Future Fisheries Improvement Program, the Bull Trout and Cutthroat Trout Enhancement Program, the River Restoration Program or other available department funds for voluntary water leases or other water augmentation measures to be used for emergency in-stream flows.

Stream Permitting

Under the Montana Stream Protection Act (SPA) and the Montana Natural Streambed and Land Preservation Act ("310 law"), FWP reviews proposed projects that may affect aquatic resources. The department uses hydrology, engineering and fish habitat principles to review projects proposed by government and private parties. Some, but not all, projects require field inspections. The department then recommends modifications or mitigation measures necessary to protect fisheries or fish habitat.

Description of current operations and/or areas of work

The regional fisheries personnel review proposals and conduct environmental reviews of land and water management activities planned by numerous federal and state agencies, and private entities including: U.S. Forest Service (USFS), Bureau of Land Management (BLM), National Park Service (NPS), U.S. Fish and Wildlife Service (USFWS), U.S. Bureau of Reclamation (BOR), Federal Energy Regulatory Commission (FERC), Montana Department of Natural Resources and Conservation (DNRC), Montana Department of Transportation (MDT), Montana Department of Environmental Quality (DEQ), public and private hydroelectric developers and operators, oil and gas pipelines, and private aquaculture operations.

FWP provides comments and technical advice as necessary to reduce or mitigate effects of projects on fish populations and aquatic habitat resources. It promotes proper aquatic habitat and fishery management by providing accurate and sound information on habitat and ecological principles, fish populations, aquatic resources, and economics to federal and state agencies, private landowners, special interest groups, and the general public.

Under the provisions of the SPA, state, county, municipal and political subdivisions must notify FWP about construction projects that may affect the bed or banks of any stream or its tributaries. FWP reviews the projects and makes recommendations to the applicant to eliminate or reduce any adverse impacts.

All applications from the MDT are handled by the FWP Fisheries Bureau in Helena. Through a Memorandum of Understanding (MOU) with the MDT, FWP reviews construction plans and erosion control plans for road construction, makes recommendations, and monitors the projects for compliance. Several federal agencies have also entered into a MOU with FWP concerning implementation of the SPA.

The Montana Natural Streambed and Land Preservation Act (310 law) requires fisheries staff to review proposed streambed or stream bank projects in cooperation with the local Conservation District Board of Supervisors. Staff also makes recommendations to reduce or eliminate impacts to the streambed or stream bank and thereby protect fish habitat.

In addition to the SPA and 310 Law, FWP has been granted the authority to issue a “318 authorization”, or a short-term narrative standard for water quality related to construction activities as established by state law. DEQ developed a programmatic environmental assessment outlining project types and dimensions for which FWP can issue 318 authorizations.

Special issues, challenges or initiatives

Coordination with MDT on highway projects is important. FWP delivers presentations to MDT’s bridge, hydraulic, and project development engineers regarding the role of stream function and habitat in permitting decisions. This fosters working collaboratively with MDT to bring about improvements to the permitting process and restoration projects.

Applicable laws, rules and policies

Statute (MCA):

87-5-501-9: The Montana Stream Protection Act provides that the fish and wildlife resources and particularly the fishing waters within the state are to be protected and preserved to the end that they be available for all time, without change, in their natural existing state except as may be necessary and appropriate after due consideration of all factors involved.

75-7-101-25: The Natural Streambed and Land Preservation Act intent is to provide adequate remedies for the protection of the environmental life support system from degradation and provide adequate remedies to prevent unreasonable depletion and degradation of natural resources.

75-5-318: Short-term water quality standards for turbidity, establishes standards for total suspended sediment and turbidity resulting from stream-related construction activities or stream enhancement projects.

FISHING ACCESS AND RECREATION MANAGEMENT PROGRAM

Fishing Access and Recreation Management Goals

1. Provide opportunities for people to access and enjoy the public waters of the State for fishing and other forms of water-based recreation. FWP will do so through the acquisition and development of new fishing access sites, the management of existing sites and recreation use, and through the protection of the public's right to access streams and other public waters.
2. Maintain good relationships with neighboring property owners. FWP will do so by responsibly managing the property and facilities, as well as the public that uses these sites. This includes maintaining boundary fences, addressing noxious weeds, and preventing trespass.

Background and Description

The FWP Fishing Access and Recreation Management Program encompasses a broad area of responsibility that in general facilitates access to public waters and management of recreational opportunities both on the water and at access sites.

There are a number of ways in which FWP helps to provide access to public waters. There are FWP-owned or managed public Fishing Access Sites (FAS) that provide fishing opportunities for virtually all of Montana's fish species. The number of FAS's has grown from a relatively few sites in the 1960's and early 1970's to 336 in 2012. The primary purpose of these sites is to provide access for angling (wade angling and boat/float angling). Many sites include a boat ramp. A fewer number of sites offer camping. Other types of recreation occur at these sites too, including non-angling boating, picnicking, swimming, bird watching, and in some places, hunting.

Another way that FWP helps to provide access is through agreements with private landowners. This access can be in the form of formal lease agreements through which FWP establishes an FAS on private land. There are also agreements where the landowner grants permission to the public to cross private land to gain access to a stream; these are typically walk-in, non-motorized access opportunities.

FWP works closely with other land management agencies, counties, municipalities, and other entities with authority over lands adjoining public waters, including communication and coordination, cooperative management agreements, and coordinated planning for the management of access sites and associated recreation. FWP takes into account the location of other public access sites on a waterbody when assessing the need for and placement of FWP fishing access sites.

FWP also manages water-based recreation and commercial use at fishing access sites and on some high-use rivers. This management includes special rules aimed at protecting the resources

and maintaining the quality of the recreation experience, and in some locations, a permit system to regulate commercial activities.

FWP also plays a role in advocating for and protecting the public's right to gain access to and use streams regardless of the ownership of the underlying land. This role entails guarding against undesirable changes to the Montana stream access law, proper interpretation and implementation of the law, and efforts to educate the public about complying with the law and showing respect for private property. Montana's strong stream access law provides Montana anglers with an abundance of opportunities to access the public waters of the state.

FWP Fishing Access Sites

As of 2012, FWP has 336 fishing access sites located throughout the state. The primary purpose for these sites is to provide angling access to public waters in Montana. Many sites include boat ramps; those without boat ramps provide wade or shore angling opportunities. Some sites offer camping. While angling is the primary purpose of these sites, there are other types of recreation occurring at fishing access sites including picnicking, swimming, camping, non-angling boating, wildlife viewing, and hunting.

The FAS Program is funded through the sale of fishing and hunting licenses and federal aid that comes from excise taxes on the sale of sporting goods equipment.

The FAS Program, combined with Montana's stream access law, ensures that anglers have many opportunities to enjoy rivers, streams, lakes and reservoirs throughout the state.

Description of current operations and/or areas of work

There are two primary areas of work within the Fishing Access Program: acquisition and development of new sites, and operation and maintenance of existing sites.

There are a number of factors that FWP considers when determining whether to acquire a new fishing access site. These include but are not limited to public demand for the new site, location and distance between existing sites, availability of property and willing sellers, available funding, and projected development and operation costs. The FWP regional staff is responsible for identifying sites for acquisition based on a number of factors, including existing access opportunities, public demand for new sites, presence of willing sellers, and availability of resources to develop and maintain sites once acquired. The Fisheries headquarters reviews each regional acquisition proposal based on overall access priorities and needs and available funding. The FWP Commission is the final decision-maker for FWP. All FWP land acquisitions are also subject to approval by the Land Board.

The acquisition process can be described as a balance between a "needs-driven process" where FWP is actively searching for opportunities that meet a certain access need or priority, and an "opportunity-driven process" where FWP responds to opportunities that might not be available in the future, or may become cost-prohibitive in the future.

FWP coordinates the acquisition of new access sites and is responsible for the maintenance and operation of existing sites. The majority of the funding for the FAS site acquisition is generated from anglers' license dollars and federal funding. Maintenance and enforcement budgets are being stretched to provide needed services to current sites because of increased use, more stringent environmental standards, inadequate sources of funding, and increased demands by the public for added services. The complexity of these conditions suggests that the acquisition of new access sites or development of existing sites must be linked to the availability of funds for maintenance, development, and enforcement.

After acquiring a site, FWP develops it to meet basic standards for an FWP fishing access site. This typically includes a gravel access road and parking area, vault latrine, and if applicable, a boat ramp. At some locations FWP develops primitive camping sites. Overall, FWP strives to limit development at FASs to a minimal that adequately supports the primary purpose of the sites: to provide angling access. For this reason, FWP fishing access sites typically do not have some of the amenities found at some state and federal parks, e.g., paved roads, flush toilets, and electrical or sewer hook-ups.

FWP is responsible for operating and maintaining the fishing access sites. Typical activities include fencing, facility and grounds upkeep, weed control, vandalism repairs, signs, latrine pumping, camping fee collection, maintenance of road/parking areas, landowner relations, and conflict resolution. It is important for FWP to serve as a "good neighbor" to adjoining property owners. This includes an emphasis on weed control, fire prevention, and responsible use and respect for private property.

Special issues, challenges or initiatives

The cost of acquiring and maintaining access sites is a challenge due to the limited resources available. As land values have increased over the past two decades, the cost of suitable FAS's has increased as well. Land values are expected to remain at the current (higher) levels, and future site acquisition costs will reflect that market trend. The demand for new fishing access sites exceeds the financial resources available for acquiring, developing and maintaining sites, meaning that FWP must carefully review and prioritize each request. This scrutiny includes consideration of which waterbodies are most in need of additional access versus those where it is desirable but not critical. This decision is also influenced by the real estate market and the presence of willing sellers; opportunities occur less frequently on some waterbodies compared to others.

Another challenge is the increase in non-angling types of recreation at fishing access sites. The primary purpose of the sites is to provide access for angling. The availability of federal funding is predicated on meeting this purpose. There are other forms of recreation occurring at fishing access sites besides fishing, though, including boating, tubing, picnicking, camping, bird watching, and special events. This does not automatically pose a problem but FWP is attentive to the primary purpose of the sites (angling), and the potential for conflicts with other types of use.

Applicable laws, rules and policies

Statute (MCA):

23-1-110: Improvements on developments at Fishing Access Sites. The FWP commission shall adopt rules establishing a policy whereby any proposed improvement or development of fishing access sites that significantly changes fishing access site features or use patterns is subject to notice of proposed modifications, both statewide and locally, and to opportunity for a public meeting and public comment on the advisability and acceptability of the proposal.

23-1-126: The good neighbor policy of public land use, as applied to public recreational lands, seeks a goal of no impact upon adjoining private and public lands by preventing impact on those adjoining lands from noxious weeds, trespass, litter, noise and light pollution, streambank erosion, and loss of privacy.

Administrative Rule (ARM)

12.8.107: State fishing access sites, purpose is to provide permanent public access to high-quality rivers, streams, and lakes.

12.8.701-9: Designation of primitive fishing access sites.

FAS Biennial Fee Rule (2012 – 2014): The FAS Biennial Rule is scheduled to be adopted in the fall of 2012.

River Recreation Management and Commercial Use Permitting

The popularity of some rivers in Montana has led to conflicts between users, concerns over congestion on the water and at access sites, and in some cases, impacts on the resources. The FWP Commission has authority to adopt rules governing recreational uses of all public fishing reservoirs, public lakes, rivers, and streams that are legally accessible to the public (87-1-303(2) MCA). The public prefers to recreate without restrictions on their opportunities and, if restrictions become necessary, less restrictive management actions should be used before more restrictive management actions.

Under this authority, FWP more intensively manages angling and other forms of water-based recreation at some access sites and on some bodies of water. This is usually in response to concerns about the quality of the social experience and/or the volume of use having an undesirable impact on the resources. FWP uses a variety of management tools to address these concerns including greater staff presence at sites and on the water, information on ways users can minimize conflicts with other users, permit systems for commercial use, and in some situations, special rules aimed at reducing conflicts.

FWP may approve commercial use that helps FWP to achieve its resource management goals and/or provides desired services to the public. Commercial use is a privilege, not a right, and must be properly managed. Commercial use includes any person, group, or organization that

makes or attempts to make a profit, vend a service or product, receive money, amortize equipment, or obtain goods or services as compensation from participants in activities occurring on land that is under the control, administration and jurisdiction of FWP. Examples of commercial use include trail rides, guided walks or tours, float trips, guided angling or hunting, game retrieval, professional dog training, equipment rentals, retail sales, food concessions, filming, firewood cutting, construction related activities, and research when accompanied by paying clients.

Description of current operations and/or areas of work

The Commission adopted Statewide River Recreation Rules in 2004 to provide guidance and direction to FWP when managing recreation on rivers, including the development of management plans and rules. In 2012, there are six rivers that are managed under special management plans or rules and four of these are the responsibility of the FWP Fish and Wildlife Division (the other two, Alberton Gorge and Smith River State Park, are currently managed by the FWP Parks Division). The Beaverhead and Big Hole rivers are managed under rules that restrict the number of licensed fishing outfitters and the number of client days they can conduct. There are also rules restricting float outfitting and nonresident float fishing on certain days of the week and certain sections of river.

The Blackfoot and Madison rivers are managed under a Special Recreation Permit system in cooperation with the Bureau of Land Management. A permit is required to conduct commercial use, a competitive event, or organized group activity. There are no limits on the number of permits available. FWP adopted a recreation management plan for the Blackfoot River in 2010 and is currently developing a plan for the Madison River at the time of this writing (2012).

FWP manages commercial use through a permit system and fees. There are two types of commercial use permits: the Fishing Access Site Permit and the Restricted Use Permit. The FAS Permit is used to authorize water-based service providers (fishing outfitters and guides, whitewater guides, etc.) at the majority of fishing access sites. The FAS Permit is valid at the majority of FWP fishing access sites around the state. The Restricted Use Permit is available to water-based service providers on restricted rivers (Beaverhead, Big Hole, Blackfoot, Madison) and all other forms of commercial use occurring on FWP lands.

Special issues, challenges or initiatives

Fishing outfitters and guides provide a desired service to some members of the angling public. The outfitting industry is also important to the state's tourism economy. It is necessary to manage this type of commercial use to ensure that it is compatible with the general, non-guided angling public. On many waterbodies, compatibility is not an issue. There are some rivers, however, where the public has expressed concern over the impact of commercial use on the general angling public. FWP has responded in a number of ways, including restrictions on the number of outfitters authorized to operate on a waterbody, a cap on the volume of use allocated to each authorized outfitter, and special rules that specify days of the week and/or sections of rivers where outfitting is restricted or prohibited.

Conflicts between user groups, e.g., between wade anglers and float anglers, and concerns about congestion on the water and at access sites, can require special management attention. FWP has special regulations on some rivers, e.g., regulations that prohibit angling from a boat, or

regulations that prohibit nonresident float fishing on some sections of river. These types of regulations are intended to resolve social concerns and for the most part are not addressing resource problems. The FWP Statewide River Recreation Rules are intended to guide development of management plans and rules for these purposes.

Applicable laws, rules and policies

Administrative Rule (ARM):

12.11.401 –55: Statewide River Recreation Management Rules establish the policies and procedures for developing river recreation management plans and rules.

12.14.101 –70: Commercial Use Rules establish the policies and permit requirements for commercial use at state parks, fishing access sites, and wildlife management areas.

Commercial Use Permit Biennial Fee Rule (2011 – 2013). The Commercial Use Permit Biennial Fee Rule establishes the permit fees for commercial use at state parks, fishing access sites, and wildlife management areas.

Stream Access

The Montana Stream Access Law (23-2-301, MCA), originally adopted in 1985, allows the public to use all public waters for water-based recreation regardless of who owns the land underlying the water. In general, the law allows the public to use streams up to the ordinary high water mark. The public may also gain access to streams for recreational use by using a public bridge or county road. FWP promotes and defends the public's rights under this important law.

Description of current operations and/or areas of work

FWP uses various public outreach tools to educate the public and private landowners about the stream access law. It is important that people understand what the law legally allows and the importance of maintaining good relationships with private landowners. FWP encourages resource users to do so by respecting private property, being careful with campfires, and practicing good etiquette when recreating in the vicinity of private land.

FWP also works to uphold the public's right to use the public waters. In the field, FWP investigates reports of landowners or the recreating public abusing the law. FWP also investigates stream barriers and helps to establish reasonable and safe portage routes. Stream access issues frequently arise during the Montana legislative sessions and FWP often provides testimony on this topic.

Special issues, challenges or initiatives

Montana has a long history of embracing private property rights. There are some people who view the stream access law as an infringement on these rights and therefore advocate for laws that would diminish or eliminate the stream access law. FWP continues to monitor these efforts and advocates for the rights of sportsmen and women of Montana. FWP also emphasizes the importance of respecting private property and that the recreating public must play an active role

in maintaining good relations with landowners. This responsibility includes attentiveness to private property boundaries, prevention of wildfires and the spread of noxious weeds, and recreating in a respectful manner when in the vicinity of private land.

Applicable laws, rules and policies

Statute (MCA):

23-2-301: Montana Stream Access Law allows the public to use all public waters regardless of who owns the land underlying the water.

23-2-408: Rulemaking for access to the Smith River.

STATEWIDE FISHERIES MANAGEMENT PLAN: PART II

Fisheries Management Direction for Drainages and Waterbodies

Introduction to Part II of the Plan

Part II of the Plan provides specific fisheries management direction for 40 drainages in the state of Montana (see statewide map on page 73). Each drainage plan includes a drainage map, a narrative section, and a management direction table. The narrative section provides an overview of conditions in the drainage and consists of four parts: Physical Description, Fisheries Management, Habitat, and Fishing Access. The table provides management direction and habitat needs for individual species or groups of species on a waterbody basis in each drainage. Descriptions of the terms used in each column of the tables are as follows:

Water: Waters are listed beginning at the upstream end of the drainage and proceeding downstream. Mainstem waters are listed first, followed by tributaries and lakes off the mainstem.

Species: Not all species in the waterbody are listed in the table. Only those for which specific management direction has been established are listed. This list typically includes most principal game species, important forage species, and Species of Concern.

Origin: Three types of origin are indicated. More than one type may apply in any given situation:

- A. **Hatchery.** Fish are stocked directly from a state, federal or private hatchery as fry, fingerlings or catchables (> 8 inches for trout). Applied primarily to lakes and ponds where natural reproduction is lacking or unable to meet angler demands. Includes eggs that were produced from wild brood, but hatched and raised in a hatchery prior to stocking.
- B. **Wild.** Fish are spawned and reared in their natural habitat. This applies to almost all stream and river fisheries in the state, as well as to some lakes and ponds where natural reproduction is capable of meeting angler needs. Also applies to situations where natural reproduction is assisted through the use of habitat enhancements to improve spawning beds or gravels.
- C. **Transfer.** Fish are wild, but transferred from one waterbody to another. Used primarily in eastern Montana to “seed” barren lakes which have suffered from drought or winterkill, or to provide forage for game species in receiving waters.

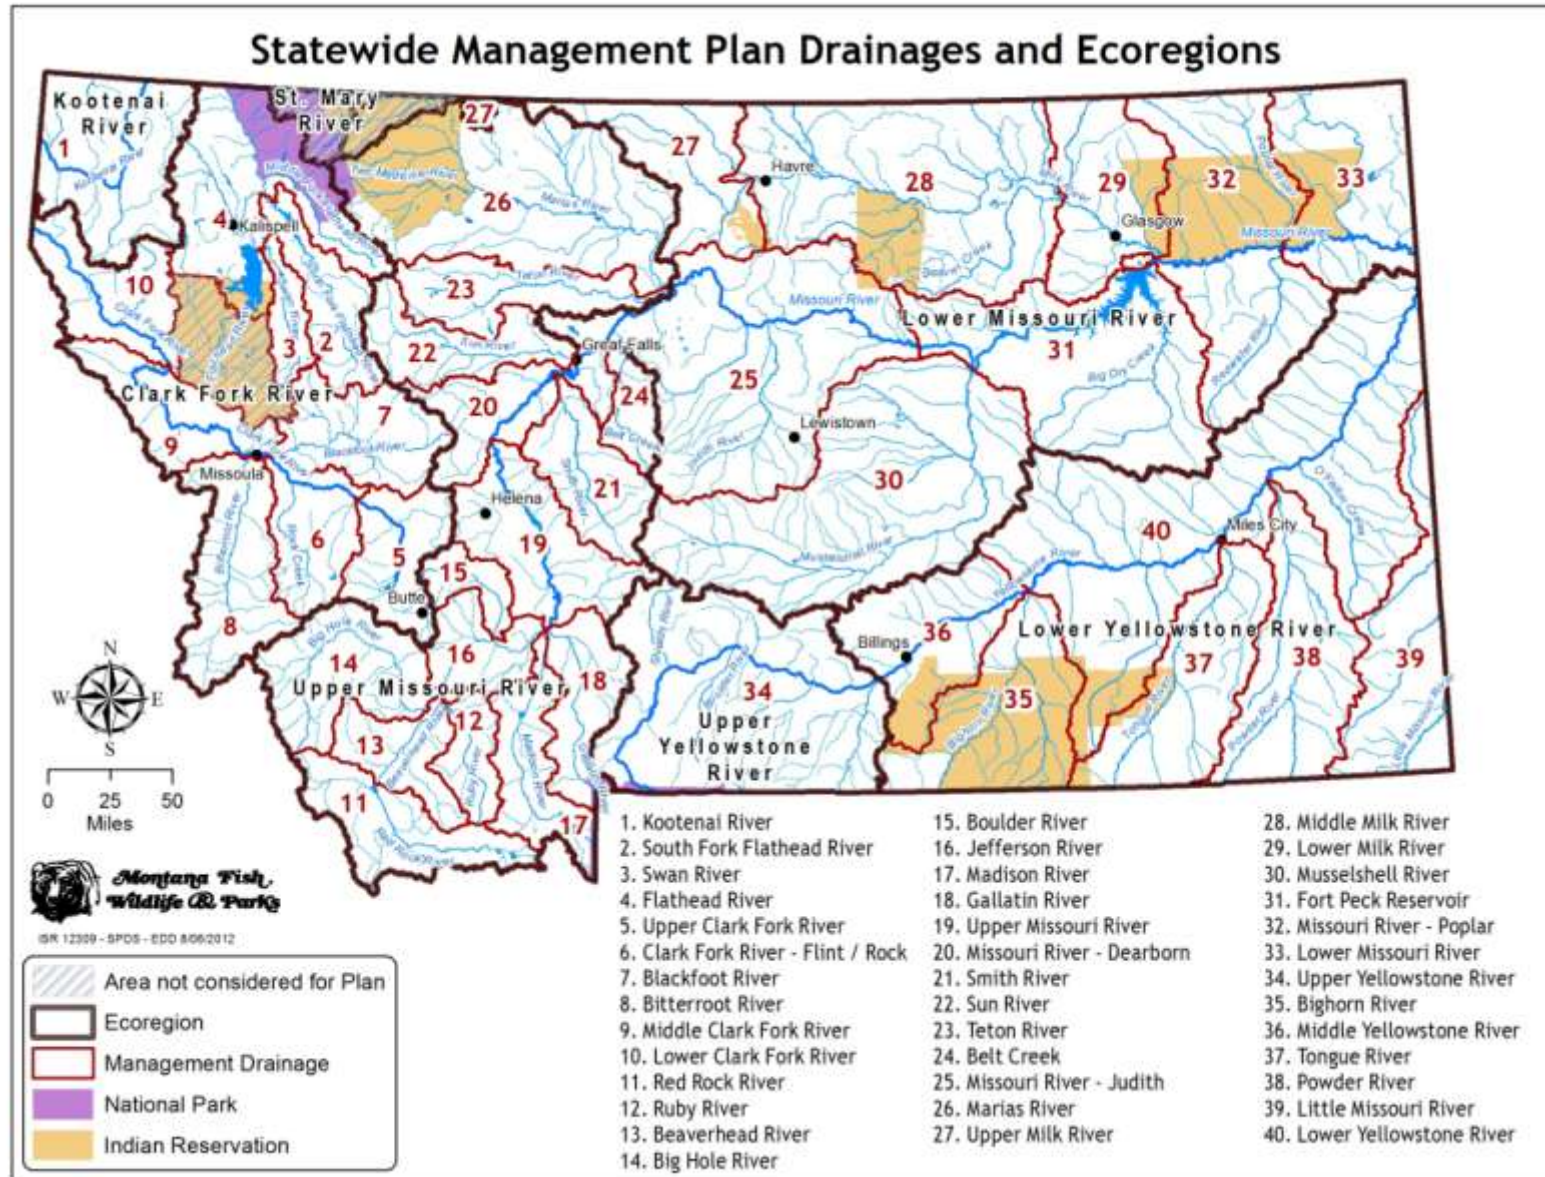

Management Type: Eight management types are identified. More than one type may apply in any given situation:

- A. **Put and Take.** A management approach using stocking of catchable size (larger than 8 inches) hatchery rainbow trout to provide high consumptive catch rates. Applied to lakes, ponds, and reservoirs and certain streams or stream reaches with good access and moderate to high fishing pressure. Used where long-term survival and growth is limited due to habitat characteristics or high harvest rates.

- B. **Put, Grow and Take.** A management approach using hatchery fry or fingerlings to provide angling opportunities on small lakes, ponds, and reservoirs and certain streams or stream reaches. Used where long-term survival and growth is limited due to habitat characteristics or high harvest rates.
- C. **Special regulations.** A management approach that relies on the natural production potential of a water body to provide angling opportunity for native fish or naturalized populations of introduced fish. Regulation exceptions to District Standard regulations are in place to protect or manipulate population levels or sizes in response to angler desires or pressure.
- D. **Quality.** A management approach that changes, by regulation, the size and/or numbers of fish which may be harvested in order to provide increased catch rates for larger fish which are considered quality or trophy size. This type of management may be applied to water areas or to specific species.
- E. **Conservation.** A management approach that may or may not allow angling and harvest in order to protect and rebuild the viability of a native fish population. This type is used in situations where management efforts (fishing regulations, habitat enhancements, land acquisitions, flow leases, etc) are actively underway or contemplated to protect and rebuild populations. This type may also be applied to native non-game species or species groups.
- F. **Family Fishing Water.** A management approach applied to a water body emphasizing family-oriented fishing opportunities typically with simplified rules including no size or tackle restrictions. Includes waters classified as Children's Fishing Waters in Fishing Regulations Booklet.
- G. **Suppression.** A management approach that relies on one or more means to reduce or eliminate the presence of a species. The means may include liberal angler harvest limits, physical removal or chemical removal. Applied to situations where the species being suppressed is in conflict with other managed species in that waterbody.
- H. **General.** A general management approach applied to waters which do not fit the designations above and are often considered harvest fisheries (in the case of game species). Fishing is managed through natural production and no special regulations are applied. Can apply to either native or introduced species.

Management Direction: Two terms are frequently used:

- A. **Recreational fishery.** This refers to a fishery with enough angler interest to generate management emphasis or effort. Recreational fisheries include situations with a full spectrum of harvest, ranging from waters where low levels of harvest occur (large stream trout fisheries) to situations where high harvest for consumption often occurs (kokanee fisheries, lakes with yellow perch or stocked trout).
- B. **Quality fishery.** Refers to a fishery where the species excels in terms of either catch rates, large sizes, numbers of fish or fish in good condition.

KOOTENAI RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Kootenai River drainage is located in the extreme northwest corner of Montana and is entirely in Lincoln County. It originates in southeastern British Columbia (BC), flows south and west through Montana, and northwest through Idaho, then returns to Canada where it flows through Kootenay Lake and joins the Columbia River at Castlegar, BC. At the Idaho border near Leonia (lowest point in Montana 1820 ft above sea level), it drains approximately 13,000 square miles with an average discharge of 16,100 cfs. There are 110 lakes or reservoirs in the Kootenai River Drainage, totaling 34,869 surface acres.

Libby Dam was completed in 1972 and created Lake Koocanusa which inundated and eliminated 109 miles of the mainstem Kootenai River and 40 miles of critical, low-gradient tributary habitat in Montana and BC. At full pool, Lake Koocanusa covers 46,500 acres total and 28,723 acres in Montana. A selective withdrawal system was installed on Libby Dam to control the temperature of water releases from the dam. The operation of Libby Dam for flood control and power production has changed the natural seasonal and daily flow, temperature, and productivity regimes in the Kootenai River. Mean flows during spring runoff have declined 50 percent and wintertime flows have increased substantially. Average wintertime water temperatures have increased by about 7° F, resulting in the river remaining virtually ice free. The 104 miles of Kootenai River in Montana can be divided into two distinct reaches, the 54-mile section downstream of Libby Dam (Lower Kootenai) and the 50-mile section upstream of Libby Dam (Lake Koocanusa).

LOWER KOOTENAI RIVER

The 54-mile section of Kootenai River downstream of Libby Dam is characterized by a complex combination of riffles, pools and slow moving, broad, meandering river sections. About 28 miles downstream of Libby Dam the river cascades 30 feet over the main Kootenai Falls and then drops another 60 feet through smaller falls in just less than a mile. Downstream of Kootenai Falls the river flows through a canyon which forms pools as deep as 100 feet. From there it flows similarly to the river upstream of Kootenai Falls but with more deeper, slower moving runs to the Montana/Idaho border.

Numerous tributaries drain the Cabinet, Selkirk and Purcell mountain ranges and enter the Kootenai River directly or through larger tributaries. Due to past glaciations, some Kootenai River tributaries are blocked by falls near their mouths, and recruitment of fish to and from those tributaries is limited. The majority of waters in the Kootenai River produce fishing for trout. The Kootenai River and its tributaries, mountain lakes (including those in the Cabinet Wilderness and Northwest Peaks), lowland lakes (including portions of the Thompson Chain of Lakes), Bull, Spar, Island and Kilbrennan Lakes and Fisher River, Yaak River and Libby Creek all provide some type of recreational fishing.

LAKE KOOCANUSA

The approximately 50-mile section of Kootenai River upstream of Libby Dam is completely inundated by Lake Koocanusa. Tributaries drain the Whitefish, Salish and Purcell mountain ranges and Southern Continental Range and enter the Kootenai River in British Columbia or Lake Koocanusa directly or through larger tributaries. The majority of streams that flow into Lake Koocanusa provide fishing for trout. Lake Koocanusa and its tributaries (most notably the Tobacco River and Big Creek), mountain lakes (including in and around the Ten Lakes Scenic Area), lowland lakes (including the Eureka Chain Lakes) and Dickey and Murphy Lakes all provide some type of recreational fishing.

FISHERIES MANAGEMENT

The Kootenai River and all its tributaries are managed as wild trout fisheries, emphasizing natural reproduction. The basin is also the focus of native fish recovery efforts. There are over 60 mountain and valley lakes and reservoirs in the Kootenai drainage that consistently provide more than 100,000 angler days of fishing for trout, salmon and other species of fish. There are sixteen native fish species in the Kootenai River drainage including bull trout, white sturgeon, redband trout, westslope cutthroat trout, burbot, kokanee salmon, mountain and pygmy whitefish, northern pike minnow, peamouth chub, longnose dace, redband shiner, longnose and largescale suckers, and torrent and Columbia slimy sculpins. Eleven nonnative fish species inhabit the Kootenai including brook trout, brown trout, rainbow trout, lake trout, northern pike, smallmouth and largemouth bass, yellow perch, black crappie, pumpkinseeds and black bullheads.

Inland redband trout (Montana's only native rainbow trout) are found in the Kootenai River drainage in the mainstem Kootenai River downstream of Libby Dam and above barriers in some tributaries (primarily in the Yaak and Fisher rivers and Libby and Callahan creeks).

Unfortunately, hatchery rainbow trout have been widely introduced throughout the drainage since before the turn of the last century. Genetics work indicates that pure-strain redband populations are rare and historic stocking of coastal strains of rainbow trout have produced a naturalized wild hybridized population and has caused loss of much of the original distribution for redband trout. Though several tributaries to the Kootenai River have relatively low levels of hybridization, the only truly secure pure-strain redbands are in Callahan Creek and East Fork Yaak River, where barrier falls stop access of hybridizing species.

Large (up to 30 lbs) rainbow trout exist downstream of Libby dam to near the Fisher River (3.5 river miles). The trout grow large because kokanee salmon from Lake Koocanusa are entrained through the dam and provide an excellent food source on which to grow. These rainbow trout migrate very little and through the years appear to have created a genetically unique population. Restrictive regulations have been in place since 1994 to protect and enhance this population.

Bull trout are found throughout the Kootenai River drainage, with fluvial populations moving throughout the Lower Kootenai and the major tributaries of the Fisher River, Libby Creek and Quartz Creek upstream of Kootenai Falls and Callahan Creek and O'Brien Creek downstream of the Falls. Two adfluvial populations exist: 1) Lake Koocanusa where some spawn in Grave Creek, but the vast majority spawn and rear in British Columbia tributaries, especially the

Wigwam River; and 2) Bull Lake, a disjunct population separated from the main Kootenai by a falls on Lake Creek. Resident life forms likely exist in many smaller tributaries throughout the drainage, although the only confirmed resident population exists in Libby Creek upstream of Libby Falls. Special fishing regulations (timing closures, complete closures) exist on some spawning streams to protect bull trout. The fishing closure between Libby Dam and Fisher River to protect spawning rainbow trout also serves to protect bull trout during that time.

In 2004, the FWS authorized limited sport fishing for bull trout on Lake Koocanusa as requested by FWP after those fisheries were deemed to have reached recovery goals. This activity was intended to benefit the species by researching the effects of restoring recreational fishing. In addition, allowing angling for bull trout increased public support for management of a stable bull trout population in Lake Koocanusa. One condition of the permit from the USFWS called for a bull trout permit and catch card system, angler survey, and development of educational information pertaining to the new fishery. The seventh year of the angling for bull trout in Lake Koocanusa concluded in 2011. Since 2004, just over 12,000 anglers obtained catch cards; they spent over 28,000 days fishing for bull trout, caught more than 14,000 and harvested 2,182 bull trout. Anglers released nearly 90 percent of the bull trout they caught at Lake Koocanusa. In 2012, MFWP determined that harvest (both in Montana and British Columbia) had negatively affected the bull trout population enough to warrant changing the regulation to catch and release. The regulation will remain in effect while FWP determines the most prudent way to re-establish the harvest fishery. This will include efforts to work with British Columbia to create commensurate regulations.

Burbot (ling) are native to the Kootenai River drainage, upstream of Libby dam in Lake Koocanusa and Sophie and Glen Lakes, and downstream in the mainstem Kootenai River. Since the creation of Libby Dam, the downstream population has decreased substantially from historic levels. Over-fishing and lack of successful reproduction are considered to be the main reasons for the population decline. This is likely caused by alteration of the natural flow regime for flood control and power production, and the changes to the river ecosystem in terms of flow, substrate, temperature and nutrients. Elimination of former sloughs and backwaters from decades of diking (in Idaho) are also suspected of contributing to their decline. Though fishing regulations still allow for harvest of burbot in the Kootenai River, the angling effort has dropped to near zero. The burbot population in Lake Koocanusa has fared slightly better. Burbot numbers expanded substantially after Lake Koocanusa was initially formed. As the reservoir has aged, numbers and fishing pressure have waned, although there is still a stable population. A fishing closure during spawning (January 15 through February 28) was enacted in 1992 at the request of local anglers.

The Kootenai downstream of Kootenai Falls is also home to a genetically distinct population of white sturgeon. The fishery for white sturgeon has been closed for conservation purposes since 1979 in response to major declines in this population. The Kootenai River white sturgeon was listed as an Endangered Species in 1994. The Kootenai River White Sturgeon Recovery Strategy is currently guiding recovery actions in the basin including flow manipulation, habitat improvement and hatchery supplementation.

Other native salmonids include westslope cutthroat trout and mountain whitefish. Non-native brook trout are present throughout the drainage. Brown trout were illegally introduced and first discovered in Lake Creek, but are now found in the Kootenai River downstream of Kootenai Falls. Kokanee salmon from Lake Koocanusa--entrained through Libby Dam--also enter the

Kootenai River. Nonnative lake trout are found in Spar Lake (closed basin) and have also been found downstream of Libby Dam. While the origin of these fish in the Kootenai River is unknown, it is probably from an illegal plant.

HABITAT

The Kootenai River basin has annual precipitation ranging from 20-80 inches and snowfall from 40-300 inches. Except during spring runoff when the river and reservoir experience increased turbidity, suspended sediment in the river is generally minimal, making the Kootenai River and Lake Koocanusa clear with good visibility for most of the year.

Roughly 90 percent of the drainage is forested and logging and associated road building has occurred in nearly all of the lower-elevation valleys and on many higher-elevation ridges. The combination of legacy of land management, roading and some large flood events have altered many streams and led to over-widened and braided sections. Streams in this condition tend to have mobile substrates that are less hospitable for insects and therefore numbers of salmonids.

Coal and hard rock mining are prominent activities in the Kootenai basin, particularly along the Elk and St. Mary rivers in BC and in the northern Cabinet Mountains. Recently proposed additional open pit coal mining has led the Montana Department of Environmental Quality to list Lake Koocanusa as threatened due to selenium. The Sullivan Mine at Kimberley, BC has been the largest metal producer in the basin and in 1981 it was one of the two largest lead-zinc mines in the world. From 1981 to the present, a large copper and silver mine and chemical floatation mill has operated in the Lake Creek watershed south of Troy, MT. Another copper silver mine (Montanore) is proposed in the headwaters of the Libby Creek drainage.

Dam operations represent the greatest impact to habitat in the Kootenai River because of the biological effects associated with unnatural flow fluctuations, reversed hydrograph (high flows in winter, low flows in summer), and real potential for gas supersaturation problems arising from spilling water. Water temperatures and seasonal thermal regimes of the Kootenai River have been unnaturally altered by the construction of Libby Dam. The selective withdrawal system which was installed on Libby Dam to control water temperatures has provided for the release of more natural water temperatures from late spring through fall; however, the system does not operate during winter months due to isothermal conditions of the reservoir and consequently, winter water temperatures remain warmer than prior to closure of Libby Dam.

Dam operations also impact fish populations in Lake Koocanusa. After an initial surge of productivity when the reservoir was first formed, there has been a slow decline in productivity toward oligotrophy (very low productivity). Between 1977 and 2000, reservoir drawdowns averaged 111 feet, and although they have not been as dramatic since then, they still affect all biological trophic levels and influence the probability of subsequent refill during spring runoff. The reservoir has shifted from a westslope cutthroat/mountain whitefish dominated system to one dominated by northern pike minnow, peamouth chub and kokanee salmon.

The Bonneville Power Administration is required to mitigate for the construction and operation of Libby Dam, and accomplishes much of this by funding the FWP fisheries mitigation program. Mitigation efforts, both onsite (operational) and off-site, are underway to protect, reopen, or reconstruct habitat to partially offset the loss.

FISHING ACCESS

There are 6 publicly owned or managed access sites along the Kootenai River. Acquiring additional access sites along the Kootenai River is a goal, especially downstream of Libby. There are seven (plus one proposed) publicly owned accesses on Lake Koocanusa that access the reservoir at various drawdown levels. The Koocanusa access sites also provide convenient land-based recreation opportunities. None of the Koocanusa or Kootenai River sites are owned by FWP. There are also more than 30 publicly owned/operated boating access sites at many of the larger valley lakes in the drainage.

SPECIAL MANAGEMENT ISSUES

Rainbow trout numbers and mean relative weights directly downstream of Libby Dam have decreased dramatically in recent years and are lower than rainbow trout collected historically and in other downstream sections of the Kootenai River. Possible reasons for the lower condition near Libby Dam include water temperatures, an altered invertebrate community, and presence of a nuisance diatom, *Didymosphenia geminata* that has affected the Kootenai River since 2000. Commonly referred to as "Didymo" or "rock snot", this diatom is found mostly in cold clear streams and rivers including downstream of dams in much of North America. Didymo attaches itself to the streambed by a long stalk and poses a threat to the aquatic ecosystem because it forms extensive mats on stream beds. Those mats exclude many aquatic insect species important to salmonids. Mat production by Didymo is lowest in the summer and early fall months following elevated discharges from Libby Dam. The mats begin to die off in late March and early April and elevated discharges for white sturgeon recovery will remove varying amounts of mat material but never all of the diatoms. During peak mat production, Didymo has the potential to exclude important aquatic invertebrate species including mayflies and caddisflies.

FISHERIES MANAGEMENT DIRECTION FOR KOOTENAI RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Lake Koocanusa	46,500 acres total 28,723 acres in Montana	Bull trout	Wild	Conservation	Provide catch-release recreational opportunity and reinstate limited harvest if compatible. Monitor recreational fishery including by-catch by anglers fishing for large rainbow trout and during derbies. Monitor population in Montana and work with British Columbia counterparts to establish adequate protection to insure opportunity for angling on both sides of the border.
		Rainbow trout	Wild	Quality	Manage harvest to promote trophy fishery opportunity. Monitor recreational fishery all year including during derbies.
		Gerrard rainbow trout	Hatchery	Put-Grow-Take/ Quality	Provide trophy harvest and recreational fishery. These are sterile progeny of trout known to reach trophy size. Maintain no- take regulations for marked fish less than 22 inches to promote growth to trophy size.
		Kokanee salmon	Wild	Special Regulations	Manage harvest to enhance numbers and sizes. Monitor population in Montana and British Columbia to identify population structure and opportunities to improve length at harvest for angling on both sides of the border.
		Burbot	Wild	Special Regulations	Manage harvest to protect spawning adults. Monitor population in Montana and British Columbia to identify population structure and opportunities to improve length at harvest for angling on both sides of the border. Identify potential for population enhancement through hatchery augmentation
Habitat needs and activities: In cooperation with MDEQ, monitor lake water and sediment quality and fish to determine effects of selenium produced from British Columbia open-pit coal mines. Identify reservoir operations that improve reservoir productivity and quality angling.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Tobacco River and Tributaries - Headwaters downstream to Lake Koocanusa	22.9 miles	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Educate anglers on catch-and-release techniques to reduce by-catch mortality. Continue to work with agencies to improve habitat in core areas. Work with irrigators and agencies to eliminate adult loss and reduce/eliminate fry loss in system
		Westslope cutthroat trout	Wild	General	Enhance fluvial populations for conservation and angling opportunities.
		Rainbow trout	Wild	General	Maintain current angling opportunity and harvest level.
		Brook Trout	Wild	Suppression	Where practical, maintain liberal harvest opportunities. Where feasible reduce/eliminate competing populations to meet native species goals.
Habitat needs and activities: Water rights are over allocated in Grave Creek; work with irrigators to maintain/improve flows to support native species.					
Eureka Chain Lakes	149 acres 35 acres 31 acres 37 acres	Rainbow trout, (Gerrard, Eagle Lake, Redband)	Hatchery	Put-Grow-Take	Maintain current angling opportunity and harvest level. For Lost Lake, manage trout harvest to enhance size. Do strain evaluation to determine age class success and return to creel.
Frank		Kokanee salmon	Hatchery	Put-Grow-Take	Where and when feasible (Frank Lake) based on hatchery availability and water quality (alkalinity levels), provide opportunity for recreational harvest
Lost					
Timber		Brook trout	Hatchery	Put-Grow-Take	Conduct EA on feasibility of re-introducing brook trout into selected closed basin lakes
Rock					
Other Small Lakes					
Habitat needs and activities: Monitor total alkalinity, dissolved oxygen levels and lake elevations to help determine stocking success					
Glen Lake	301 acres	Kokanee	Hatchery	Put-Grow-Take	Maintain current angling opportunity and harvest level. Continue to monitor population and determine stocking rates that promote opportunity for larger kokanee.
		Rainbow trout (Gerrard)	Hatchery	Quality	Explore opportunity to stock limited number of gerrard rainbow trout to produce trophy fishery

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Continued on next page		Burbot	Wild	General	Identify source of burbot. Maintain limited harvest and recreational opportunity. Monitor population to identify population structure and opportunities to improve length at harvest for quality angling through regulation. Identify potential for population enhancement through hatchery augmentation
Habitat needs and activities: Work with Lincoln County to reduce impacts of shoreline construction. Lake elevations are controlled by Glen Lake irrigation district.					
Ten Lakes Scenic area lakes:		Westslope cutthroat trout	Wild/Hatchery	Put-Grow-Take/ General	Maintain current angling opportunity and harvest level. Where practical enhance populations to meet native species goals. Where feasible, protect non-introgressed populations and restore genetic integrity to introgressed populations. Adjust/eliminate stocking in lakes with natural reproduction.
Upper Wolverine	8 acres				
Lower Wolverine	5 acres				
Rainbow	9 acres				
Blue Bird	3 acres				
Bat	5 acres				
Big Therriault	56 acres				
Little Therriault	28 acres				
Tetrault (Carpenter) Lake	96 acres	Rainbow trout (Gerrard), Eagle Lake, redband), Westslope cutthroat trout	Hatchery	Put-Grow-Take	Maintain current angling opportunity and harvest level.
Sophie Lake	221 Acres	Rainbow trout (Gerrard, Eagle Lake, Redband) Westslope cutthroat trout	Hatchery	Put-Grow-Take	Maintain current angling opportunity and harvest level.
Continued on next page		Kokanee salmon	Hatchery	Put-Grow-Take	When feasible based on hatchery availability, provide opportunity for recreational harvest

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Burbot	Wild	General	Identify source of burbot. Maintain limited harvest and recreational opportunity. Monitor population to identify population structure and opportunities to improve length at harvest for quality angling through regulation. Identify potential for population enhancement through hatchery augmentation
Kootenai River and Tributaries - Libby Dam Downstream to Fisher River	3.5 miles	Bull Trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Educate anglers on catch-and-release techniques to reduce by-catch mortality. Continue to work with agencies and mining interests to improve habitat in core areas.
		Rainbow trout	Wild	Quality/ Special Regulations	Continue to improve fishery through restrictive regulations to promote trophy sizes. Identify limiting factors leading to recent declines.
		Mountain whitefish	Wild	General	Maintain numbers. Continue to monitor population size and trend.
Habitat needs and activities: Identify limiting factors associated with <i>Didymosphenia geminata</i> and determine if blooms/mats can be reduced to improve fishery.					
Fisher River and Tributaries - Headwaters to Kootenai River	33.2 miles	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Educate anglers on catch-and-release techniques to reduce by-catch mortality. Continue to work with agencies and mining interests to improve habitat in core areas.
		Redband trout, Westslope cutthroat trout	Wild	Conservation	Maintain current angling opportunity and harvest level. Where feasible enhance populations to meet native species goals. Where feasible, protect non-introgressed populations and restore genetic integrity to introgressed populations
		Rainbow trout	Wild	General/ Suppression	Where practical, maintain current angling opportunity and harvest level. Where feasible reduce/eliminate hybridized populations to meet native species goals

SOUTH FORK FLATHEAD RIVER DRAINAGE

PHYSICAL DESCRIPTION

The South Fork Flathead River drainage includes Hungry Horse Reservoir, the South Fork Flathead River and its tributaries. The South Fork originates from the Bob Marshall Wilderness, at the confluence of Young's Creek and Danaher Creek. From its headwaters, the river flows north for approximately 60 miles through the Bob Marshall Wilderness before entering Hungry Horse Reservoir. Hungry Horse Dam, created in 1953, lies approximately 5.3 miles upstream of the confluence of the South Fork and the main stem of the Flathead River. At 564 feet, Hungry Horse was the third largest and second tallest concrete dam in the world at the time of completion. The dam is managed for hydroelectric production as well as for flood control. The South Fork Flathead watershed includes some of the most pristine forested landscape in the western United States. The majority of the land base in the South Fork drainage is publicly owned, with land management responsibilities belonging to the Flathead National Forest. The vast majority of this National Forest land is protected as wilderness, though there are roaded parcels around Hungry Horse Reservoir.

There are 62 natural lakes in the drainage, totaling 2,308 surface acres. The South Fork drainage is bordered by the Swan Mountains to the west and the Flathead Range to the east. The natural lakes present in the South Fork drainage are typically mountain lakes in the headwaters of many South Fork tributaries. The largest natural lake is Big Salmon Lake (972 acres). Few lower elevation lakes exist, with Handkerchief Lake (51 acres) being one of the larger, more popular destinations.

FISHERIES MANAGEMENT

The South Fork Flathead River drainage provides one of the most unique fisheries in Montana. Construction of Hungry Horse Dam left almost the entire South Fork isolated from the remainder of the Flathead system. Because of this isolation, the South Fork provides for an entirely native fish assemblage, with outstanding fisheries for westslope cutthroat and bull trout. The South Fork represents the largest connected population of migratory, genetically unaltered westslope cutthroat trout left in the United States. Anglers in the South Fork will find exceptional catch rates for large cutthroat in an area that provides solitude and scenery that make Montana the last best place. In addition to westslope cutthroat, anglers visiting Hungry Horse Reservoir and the upstream South Fork also have the unique opportunity to target bull trout, a species listed as threatened under the Endangered Species Act. While most waters were closed to fishing for bull trout after the listing in 1998, the South Fork drainage was reopened under a permit from the USFWS in 2004. The conditions of this permit allowed for catch and release fishing for bull trout in the South Fork Flathead River and angler harvest of two bull trout per year in Hungry Horse Reservoir. The bull trout population in Hungry Horse and the connected South Fork is typical of most adfluvial populations and anglers have the chance at targeting bull trout up to 15 pounds.

The South Fork drainage is managed as a wild, native trout fishery, emphasizing natural reproduction. The basin is also the focus of native fish recovery efforts. The South Fork drainage

is home to many native fish species including bull trout, westslope cutthroat trout, mountain whitefish, pygmy whitefish, northern pikeminnow, longnose and largescale sucker, and sculpin. The only non-native fish species present in the South Fork is Arctic grayling, although this species is limited to Handkerchief Lake, which once held the state record for angler-caught grayling. Regulations in the wilderness portion of the South Fork protect against overharvest and maintain a viable recreational angling experience while allowing the adventurous anglers to enjoy a camp meal of freshly caught trout. Guided float trips exist on the South Fork, though outfitting is regulated through a permit system administered by the USFS. The remote nature of the upper South Fork largely limits the number of anglers utilizing the river. However, anecdotal evidence suggests that angler use may be increasing and future surveys may determine the need for additional regulation.

The fishery downstream of Hungry Horse Dam provides for a limited tailwater section, though access is difficult due to steep banks and swift current. This section of river is dominated by native fish species, though rainbow and lake trout have been observed in this location. Historically, water exiting Hungry Horse Dam was released from the bottom of the reservoir, altering the stream temperature for the rest of the Flathead River downstream of the confluence with the South Fork. However, in 1995 a selective withdrawal system was installed and has since provided a more natural temperature regime. In recent years the occurrence of the diatom algae *Didymosphenia geminata* appears to have increased below Hungry Horse Dam. Scientists are currently investigating the potential impacts of the increase in diatom density.

High mountain lakes in the South Fork were historically stocked with cutthroat trout. However, modern genetic analysis has revealed that many of these cutthroat trout plants in the early part of the 20th century had genetic material other than westslope cutthroat trout. Since the 1980's any lakes stocked have been with genetically pure westslope cutthroat from the Washoe Park State Fish Hatchery. In 2007, FWP implemented a watershed-wide restoration project aimed at removing these headwater sources of non-native genes and therefore protecting the important population of the South Fork.

HABITAT

The South Fork Flathead River drainage contains some of the most pristine forest land in the lower 48 States. Much of the watershed is located within the Bob Marshall Wilderness. When combined with the neighboring Scapegoat and Great Bear Wilderness areas, the Bob Marshall Wilderness Complex is the second largest wilderness-protected land area in the lower 48 with over 1.5 million acres. Because of this level of protection, fisheries habitat remains largely in the same condition as it was prior to human civilization. Migratory fish populations thrive in connected stream networks with little man-made disturbance.

Downstream of the wilderness boundary the drainage is still largely publicly owned, with the USFS responsible for land management. As is the case with many managed forests, years of timber harvest have left a legacy of roads upon the landscape. However, while historic logging practices may have negatively impacted streams and their associated fisheries, modern forestry Best Management Practices and conservation efforts have greatly improved fisheries habitat from its previous condition. Fish passage has been provided at road crossings on either side of Hungry Horse Reservoir, maintaining connection to spawning and rearing habitat for fish

inhabiting the reservoir. Funding for this restoration work has come from both BPA mitigation as well as USFS funding sources.

FISHING ACCESS

Although there are abundant recreational fishing opportunities in the South Fork drainage, FWP has no official fishing access points. Access points along both the South Fork Flathead River and Hungry Horse Reservoir are managed by the USFS. These sites include a combination of primitive boat launches and dispersed camping as well as developed campgrounds and boat ramps designed to handle considerable traffic.

SPECIAL MANAGEMENT ISSUES

South Fork Flathead Drainage Westslope Cutthroat Trout Conservation Program

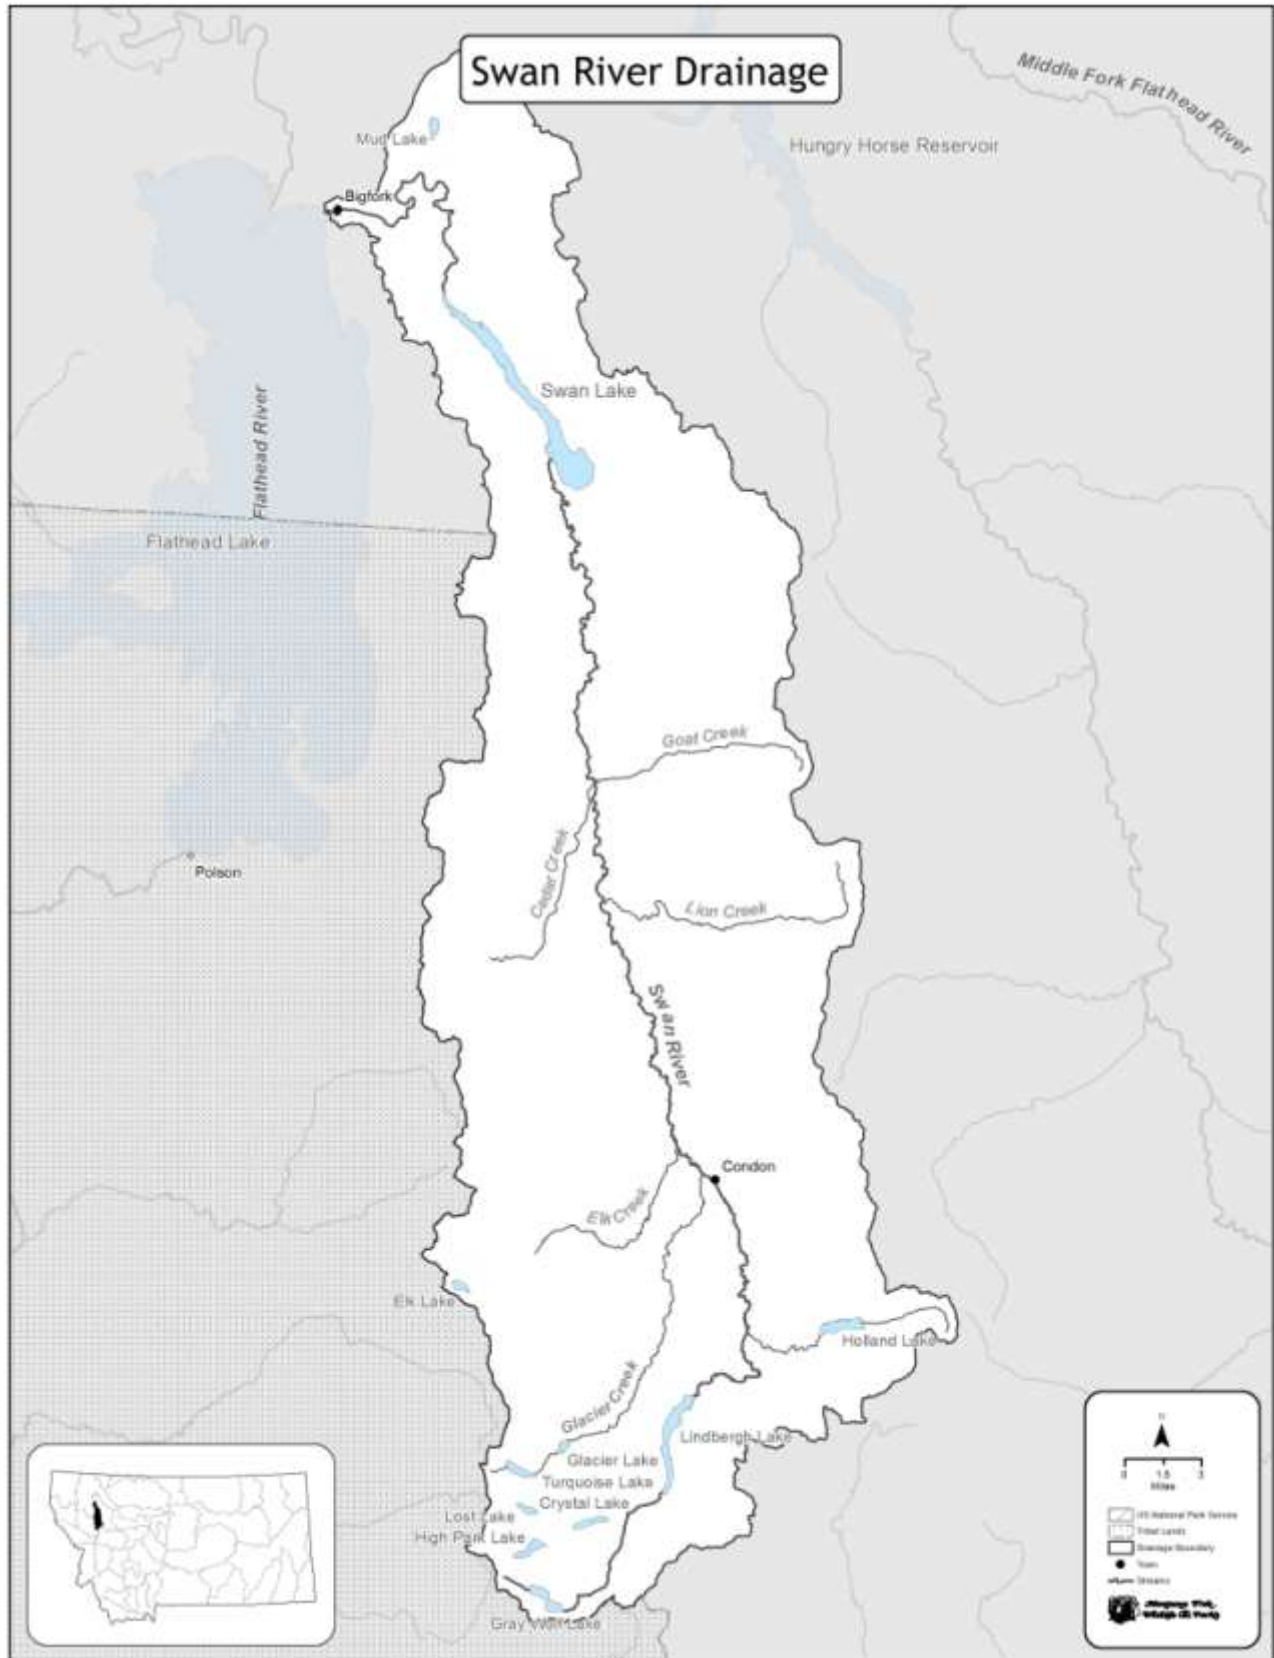

The South Fork Flathead River drainage comprises more than half of the remaining interconnected habitat for westslope cutthroat trout within this species' historic range. However, long-term persistence of this native species is threatened by hybridization with introduced rainbow trout and Yellowstone cutthroat trout that were stocked decades ago in many historically fishless headwater lakes in the South Fork drainage. In an effort to minimize the spread of hybridization, Montana Fish, Wildlife, and Parks developed the South Fork Flathead Drainage Westslope Cutthroat Trout Conservation Program. The objective of this multi-year project is to remove sources of nonnative trout in 21 lakes and reestablish these fisheries with pure westslope cutthroat trout. To date, rotenone has successfully been used to chemically remove introduced trout in ten lakes and genetic swamping is being used in an additional six lakes as an alternative technique to restoring westslope cutthroat trout. Additional efforts in the South Fork Flathead include the development and use of local broodstocks to conserve genetic variation in this native species.

FISHERIES MANAGEMENT DIRECTION FOR SOUTH FORK FLATHEAD RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
South Fork Flathead River and Tributaries (Headwaters Downstream to the Wilderness Boundary)	40 Miles	Bull trout	Wild	Conservation/ Special Regulations	Manage for catch-and-release angling through a catch-card permit system.
		Westslope cutthroat trout	Wild	Conservation/ Special Regulations/	Maintain numbers and quality of the fishery. Provide a limited harvest fishery allowing anglers to keep small fish for camp fare while maintaining large fish and spawning fish. Eliminate threats to genetic purity. Monitor westslope cutthroat trout for increases in hook scar rates and catch rates related to increases in angler use.
		Mountain whitefish	Wild	General	Maintain numbers. Begin to understand population size and trend.
South Fork Flathead River and Tributaries (Wilderness Boundary to Hungry Horse Reservoir)	20 Miles	Bull trout	Wild	Conservation/ Special Regulations	Manage for catch-and-release angling through a catch-card permit system.
		Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Provide a limited harvest fishery. Conduct population estimates as part of evaluation of the effectiveness of the short catch-and-release section. Eliminate threats to genetic purity.
		Mountain whitefish	Wild	General	Maintain numbers. Begin to understand population size and trend.
Spotted Bear Lake	12 Acres	Westslope cutthroat trout	Wild/ Hatchery	Put-Grow-Take	Provide for harvest and recreational opportunity. Continue to monitor for stocking evaluation. Plants appear to have poor success in recent years.
Hungry Horse Reservoir	23,577 Acres	Bull trout	Wild	Conservation/ Special Regulations	Regulate harvest and monitor migratory populations for conservation and angling through a catch card system.
		Westslope cutthroat trout	Wild	Conservation	Provide recreational angling opportunity. Eliminate threats to genetic purity

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Mountain whitefish	Wild	General	Provide recreational angling opportunity
Habitat needs and activities: Improve habitat to reduce disturbance, minimize future threats, and provide ecosystem function.					
Handkerchief Lake	51 acres	Westslope cutthroat trout	Wild	Conservation	Provide recreational angling opportunity. Eliminate threats to genetic purity
		Arctic grayling	Wild	General	Provide for harvest and recreational opportunity.
Habitat needs and activities: Lake is scheduled for rotenone treatment as part of the South Fork Flathead Westslope Cutthroat Conservation project. Grayling and pure westslope cutthroat will be re-stocked after treatment.					
South Fork Flathead River Drainage - Mountain Lakes	60 lakes 2,245 acres	Westslope cutthroat trout	Wild/ Hatchery	Conservation/ Put-Grow-Take	Eliminate sources of non-native trout to protect genetic purity of westslope cutthroat in the drainage. Provide recreational fishing opportunity for a variety of fish sizes and catch rates.

SWAN RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Swan River drainage includes the Swan River and its tributaries, and major lakes such as Swan Lake, Holland Lake, and Lindbergh Lake and numerous smaller lakes. The Swan River originates from the Mission Mountain Wilderness, flowing out of Gray Wolf Lake, then continuing through Lindbergh Lake. From its headwaters, the river flows north for 52 miles through Missoula and Lake Counties before entering Swan Lake. The Swan River then continues north and west into Flathead County and through Bigfork Dam, a 4.1 megawatt hydroelectric facility constructed in 1902, before entering Flathead Lake. The lowest mile of the Swan River flows through a high gradient canyon (Wild Mile) that is popular among whitewater enthusiasts. The Swan watershed includes dramatic mountain peaks in the headwaters and heavily forested slopes and wetlands on the valley floor. Much of the land base in the Swan drainage is publicly owned, with large parcels being managed by both the Flathead National Forest and the Swan River State Forest.

There are 72 natural lakes in the drainage totaling 7,125 acres. The Swan drainage is bordered by the Mission Mountains (and Mission Mountain Wilderness) to the west and the Swan Mountains to the east. Most natural lakes are mountain lakes in the headwaters of many Swan drainage tributaries on both the east and west sides of the watershed. The largest lake is Swan Lake (3,269 acres). Lindbergh Lake (815 acres) and Holland Lake (414 acres) are the other two large, valley bottom lakes and are located in the upstream end of the drainage. Several other valley bottom lakes exist (Van, Peck, Shay, Russ, and Fran Lakes) and are popular for recreation and angling opportunities.

FISHERIES MANAGEMENT

The Swan River drainage provides diverse fisheries opportunities typical of the northwest portion of Montana. While many opportunities exist for anglers to fish outstanding multi-species water bodies, the Swan is also home to one of Montana's last strongholds for bull trout, a species listed as threatened under the Endangered Species Act. The Swan drainage is a perfect example of FWP's dual mission of providing recreational fishing opportunity while conserving our valuable native fish resources.

The Swan River is managed as a wild trout fishery, emphasizing natural reproduction. The basin is also the focus of native fish recovery efforts. The Swan River drainage is home to many native fish species including bull trout, westslope cutthroat trout, mountain whitefish, pygmy whitefish, northern pikeminnow, peamouth, longnose and largescale sucker, and sculpin. Several introduced fish species also inhabit the Swan drainage including brook trout, rainbow trout, lake trout, northern pike, kokanee salmon, brook stickleback, central mudminnow, and yellow perch. The fishery of the Swan River itself is largely focused on rainbow and westslope cutthroat trout. Regulations for these two trout species protect against overharvest and maintain a viable recreational angling experience. Brook trout are also present in the upper Swan River and make up a portion of the catch when fishing the river. Guided float trips exist on the Swan River, though outfitting is regulated through a permit system administered by the DNRC and the USFS.

Though the Swan River was once a stronghold for bull trout, intentional angling is not allowed in the river upstream of Swan Lake.

The fishery downstream of Swan Lake is considerably different from the upper river. Warm outflows from Swan Lake limit trout production; though a quality rainbow trout fishery exists during spring months. Prior to entering Flathead Lake, the Swan River is impounded by Bigfork Dam. Trout habitat in the portion of river influenced by this impoundment is minimal, and the fishery is dominated by northern pike. Below Bigfork Dam, the Swan River's gradient increases dramatically and provides recreational opportunity for whitewater enthusiasts. A limited fishery for rainbow and lake trout exists in this reach, though access and wading conditions are difficult.

The Swan drainage is home to some of the most robust populations of bull trout in Montana. Adfluvial bull trout populations exist in Swan Lake, Lindbergh Lake, and Holland Lake. The bull trout population in Swan Lake has historically been so strong that when the species was listed as threatened under the Endangered Species Act in 1998, it remained the only water body in Montana where anglers could fish for, and keep, bull trout. Angling for bull trout is still permissible, however beginning in 2012, anglers are required to release all bull trout caught in Swan Lake. Intentionally targeting bull trout in Lindbergh Lake, Holland Lake, and the Swan River and its tributaries is not allowed. Spawning tributaries Elk, Goat Lion and Squeezer creeks are closed on a year round basis to prevent disturbance of bull trout and unintentional harvest of juvenile bull trout by anglers who mistake them for brook trout.

The Swan drainage contains several valley-bottom lakes that provide quality recreational fishing opportunities. Van, Shay, Fran, and Peck Lakes are all stocked with rainbow trout and provide anglers with put-and-grow fisheries with scenic value and relative solitude, as defined boat ramps do not exist. Although not directly connected to the Swan River, Loon, Horseshoe, and Echo Lakes also contain recreational fisheries for species such as largemouth bass, smallmouth bass, lake whitefish, and kokanee.

High mountain lakes are predominantly stocked with westslope cutthroat trout, except Heart Lake and Island Lake which are periodically stocked with golden trout. Many of the mountain lakes in the Swan drainage are located in high elevation, alpine settings within the Mission Mountain Wilderness or Swan Mountains. Because of the remote nature of these lakes, many are not stocked currently, and some have never been stocked historically. Stocking records for the lakes previously planted with fish reveal that undesignated cutthroat were planted prior to the development of a pure westslope cutthroat brood. Therefore, some lakes may still contain hybridized populations of cutthroat trout, regardless of modern stocking plans.

HABITAT

The Swan River valley was historically and continues to be very much a working forest. Much of the land ownership is a combination of private timber land, national forest, and Montana school trust lands. As is the case with many managed forests, years of timber harvest have left a legacy of roads upon the landscape. However, while historic logging practices may have negatively impacted streams and their associated fisheries, the Swan valley is fortunate to be at the forefront of progressive land management approaches. In 2000, Plum Creek Timber Company released its Native Fish Habitat Conservation Plan (HCP). This plan allowed for an adaptive management approach to continue to actively manage forest lands, while providing protective measures for

threatened fish species such as bull trout. Since then, the DNRC has released its own habitat conservation plan providing for many of the same conservation measures included in the effort done by Plum Creek. In addition to these plans, FWP has purchased conservation easements in many bull trout spawning streams. These easements protect the riparian vegetation necessary for bull trout spawning and rearing habitat.

In recent years, land acquisitions in the Swan drainage have been designed to protect both terrestrial and aquatic species. Important bull and westslope cutthroat trout habitat are on these lands. Land parcels that were previously checker-boarded with national forest lands have been purchased by the USFS. Similarly, former Plum Creek lands in the Swan State Forest are currently held by The Nature Conservancy, with plans to transfer ownership to the State of Montana. Additionally FWP has purchased several large conservation easements in bull trout core areas and has placed restrictions on land management to benefit bull and westslope cutthroat trout.

FISHING ACCESS

Although there are abundant recreational fishing opportunities in the Swan valley, FWP has very few official fishing access points. Access points provided by FWP include one on the lower Swan River, downstream of Swan Lake, and one on Bigfork Bay where the Swan River enters Flathead Lake. All of the other public access points in the Swan are provided by either the DNRC or the USFS. These sites include a combination of primitive boat launches and dispersed camping as well as developed campgrounds and boat ramps designed to handle considerable traffic.

The USFS provides the only public access point on Swan Lake. The site contains a day-use area, boat ramp, campground, and public swimming area. Because the site is the only public access point, it has been used by FWP for several angler surveys. Additionally, FWP maintains an InfoMax recording system at the site which broadcasts information regarding native species management, angling opportunities, and way to minimize the risk of spreading Aquatic Invasive Species (AIS).

SPECIAL MANAGEMENT ISSUES

Experimental removal of lake trout in Swan Lake

The Swan Valley has historically been home to a stable bull trout population. However, in 1998 anglers began to occasionally catch adult-sized (20-30 inch) lake trout from Swan Lake and the Swan River. This caused alarm because lake trout are not native and are notorious for rapidly expanding and dominating fish communities in lakes with *Mysis* shrimp such as Swan Lake, at the expense of bull trout and kokanee salmon. In 2003, the level of concern was compounded when biologists gillnetted juvenile lake trout from Swan Lake during standard low-intensity sampling efforts, indicating that wild reproduction was occurring. Since 2003, lake trout catch by anglers as well as during FWP's biological sampling has continued to increase, indicating that the population is likely expanding. In June of 2009, FWP approved plans for a three-year experimental removal of lake trout in Swan Lake. The project was initiated as a feasibility study to determine if targeted gillnetting can be an effective way to reduce lake trout numbers while minimizing bycatch of other fish species. From 2009-2011 over 21,000 lake trout were removed

from Swan Lake. Lake trout mortality rates appear to be high relative to other lake trout suppression projects. Additionally, lake trout catch per unit effort during netting activities decreased from 2010 to 2011, indicating that netting efforts were effective at reducing year-to-year cohort strength. Inadvertent bycatch of other fish species was relatively low, although concerns regarding bycatch of bull trout still exist. While much has been learned with regard to our ability to affect lake trout cohort strength from one year to the next, the overall effect this level of removal has on the lake trout population and subsequent benefits to other fish species remain unknown. Therefore, in May 2012 FWP released another Environmental Assessment for a five-year continuation of this removal experiment. This period of time was chosen because it represents the shortest amount of time necessary to fully assess and realize the effects of previous removal efforts. Information obtained from the proposed action will help to determine feasibility and effectiveness of alternatives for managing the lake trout population (e.g., suppression of the population).

FISHERIES MANAGEMENT DIRECTION FOR SWAN RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Swan River and Tributaries (Headwaters Downstream to Swan Lake)	52 Miles	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout and minimize incidental catch of bull trout. Maintain spawning tributary mouth closures as needed.
		Westslope cutthroat trout	Wild	Conservation/ Special Regulations/General	Eliminate harvest and enhance fluvial populations for conservation and WCT angling. Consider isolation of WCT populations if hybridization is a threat and habitat is sufficient to allow persistence.
		Rainbow trout	Wild	General/Special Regulations	Minimize harvest to provide for a quality fishery in one section. Maintain numbers to allow harvest in some sections.
		Mountain whitefish	Wild	General	Maintain numbers. Begin to understand population size and trend.
		Brook trout	Wild	General	Allow for harvest in tributaries that do not contain bull trout.
Habitat needs and activities: Stream crossing upgrades and road BMP's for most forest lands.					Enhance habitat to favor native trout and whitefish.
Lindbergh Lake	815 Acres	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout and minimize incidental catch of bull trout. Enhance migratory populations for conservation.
		Westslope cutthroat trout	Hatchery	Put- Take	Evaluate stocking to determine success to creel. Provide recreational angling opportunity.
		Kokanee	Hatchery	Put-Grow-Take	Provide for harvest and recreational opportunity
		Lake trout	Wild	Suppression	Reduce numbers to benefit native fish and recreationally important kokanee. Increase monitoring and evaluate potential tools to reduce lake trout abundance to benefit native and recreationally important fish species.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Holland Lake	414 Acres	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout and minimize incidental catch of bull trout. Enhance migratory populations for conservation.
		Wesslope cutthroat trout	Hatchery	Put- Take	Evaluate stocking to determine return to creel. Provide recreational angling opportunity.
		Kokanee	Hatchery	Put-Grow-Take	Provide for harvest and recreational opportunity.
		Yellow perch	Wild	General	Provide for harvest and recreational opportunity.
		Lake trout	Wild	Suppression	Assess status to determine need for management and potential impacts on fishery
Habitat needs and activities: Maintain open channel at inlet to allow access for spawning bull trout.					
Swan Lake	3,269 Acres	Bull trout	Wild	Conservation/ Special Regulations	Catch and release fishing allowed but not harvest. Enhance migratory populations for conservation.
		Rainbow trout, Westslope cutthroat trout	Wild	General	Provide recreational angling opportunity for occasional fish.
		Kokanee, Northern pike, Yellow perch	Wild	General	Provide for harvest and recreational opportunity.
		Lake trout	Wild	Suppression	Continue to evaluate tools to effectively reduce numbers to benefit native fish and recreationally important kokanee.
Swan River and Tributaries (Swan Lake to Flathead Lake) Continued on next page	12 Miles	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout and minimize incidental catch of bull trout.
		Westslope cutthroat trout	Wild	Conservation/Special Regulations	Eliminate harvest and enhance fluvial populations for conservation and WCT angling. Consider isolation of WCT populations if hybridization is a threat and habitat is sufficient to allow persistence.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Rainbow trout	Wild	General	Manage trout harvest to support recreational fishing and minimize impacts on native fish.
		Mountain whitefish	Wild	General	Maintain numbers. Begin to understand population size and trend.
		Northern pike	Wild	General	Provide opportunity for harvest and recreational angling.
Habitat needs and activities: Improve habitat to support ecosystem function and production of trout and whitefish. Salvage/rescue fish entrained in Bigfork Dam canal during canal maintenance dewatering.					
Echo Lake	695 Acres	Largemouth bass	Wild/Hatchery	Put-Grow-Take/ Quality/ Special Regulations	Provide for a quality recreational fishery. Maintain 1> 12" limit to maintain larger bass and protect spawners. Assess contribution of hatchery plants.
		Rainbow trout	Hatchery	Put-Grow-Take	Provide recreational angling opportunity. Assess return of stocked trout.
		Kokanee	Hatchery	Put-Grow-Take	Provide for harvest and recreational opportunity.
		Northern pike,	Wild	General	Provide recreational angling opportunity.
		Lake whitefish, Yellow perch	Wild	General	Provide recreational angling opportunity.
Habitat needs and activities: Lakeshore flooding in 2011 prompted the closing of Echo Lake to wake producing boat speeds. The lake again flooded in 2012. Weekly lake elevation surveys now occur during summer to better inform managers of potential future flood events.					
Loon Lake	45 Acres	Largemouth bass	Wild/Hatchery	General	Provide for a recreational fishery. Assess contribution of hatchery plants. Continue to monitor largemouth bass nest counts.
		Rainbow trout	Hatchery	Put- Take/ Quality	Provide for a large (>18") rainbow trout fishery and recreational angling opportunity
Continued on next page		Yellow perch	Wild	General	Provide recreational angling opportunity

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Horseshoe Lake	41 Acres	Smallmouth bass	Wild/Hatchery	Special Regulations	Provide recreational angling opportunity. Assess contribution of hatchery fish. Install habitat structures to improve spawning and survival.
		Pumpkinseed	Wild	General	
		Yellow perch	Transfer	Suppression	Yellow perch were first observed in Horseshoe Lake in 2011 as the result of an illegal plant. FWP monitoring confirmed presence and reproduction in May 2012. Eliminate harvest and suppress as possible to remove incentive to move to other waters.

FLATHEAD RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Flathead River drainage includes Flathead Lake, the Flathead River and its tributaries, including the North Fork and Middle Fork of the Flathead River (the South Fork of the Flathead is not included in this management area), the Whitefish River drainage, the Stillwater River drainage and the numerous small drainages on the westside of the Flathead Valley, draining over 7,000 square miles. The North Fork of the Flathead River begins in British Columbia, Canada and the Middle Fork in the Great Bear and Bob Marshall Wilderness areas of the Flathead National Forest. Glacier National Park lies between the two forks. Flathead Lake is bisected by the northern boundary of the Flathead Indian Reservation of the Confederated Salish and Kootenai Tribes. This management area is located in Flathead and Lake Counties. The Flathead watershed includes 10,000-foot peaks in the headwaters and heavily forested slopes, agricultural lands and wetlands on the valley floor.

There are 183 lakes in the drainage, totaling 156,966 surface acres. Numerous large lakes exist in the drainage, including Flathead Lake, Whitefish Lake, Upper and Lower Stillwater Lakes, Tally Lake, Ashley Lake, Little Bitterroot Lake, Hubbart Reservoir, Lake Mary Ronan, Lake Blaine, Echo Lake and many small valley and mountain lakes of less than 350 surface acres. There are three general types of lake settings that provide a wide diversity of fishing opportunity. There are high elevation alpine lakes that are ice free for less than half of the year that provide summer trout fishing. There are moderate elevation mountain setting lakes that are accessible most of the year providing a mix of fish species and opportunity. And there are valley floor lakes that are very accessible and provide opportunity for both warm and cold water fish species.

FISHERIES MANAGEMENT

Flathead Lake is the most popular fishery in the drainage and one of the top ten water bodies for fishing effort in Montana. Flathead Lake is large at about 123,000 surface acres. The lake's outstanding natural resources and diversity of recreational opportunities, combined with its proximity to Kalispell, Polson and Missoula, contribute to its popularity. It is a destination vacation site for Canadian and other out-of-state visitors.

Flathead Lake and river are managed as a wild trout fishery, emphasizing natural reproduction and native fish. Fishing regulations across the drainage are very restrictive for native species and very liberal for harvest of non-native fish species. The basin is also the focus of native fish recovery efforts. Flathead Lake is home to eleven native fish species including bull trout, westslope cutthroat trout, mountain and pygmy whitefish, northern pike minnow, peamouth, longnose and largescale sucker, reidside shiner, and two species of sculpin. Twelve non-native fish species inhabit the Flathead including lake trout, lake whitefish, brook trout, rainbow trout, northern pike, brook stickleback, black bullhead, largemouth and smallmouth bass, crappie and yellow perch. Dominant fish species vary from westslope cutthroat, bull trout and brook trout in the headwaters, to a mixture of warm and cold water species at lower elevations. Angling on Flathead Lake occurs year-round and is most popular in the early spring, summer and fall. Lake

trout, lake whitefish and yellow perch comprise the majority of the catch. Winter ice fishing occurs annually on bays as ice allows.

The Flathead River is the most popular stream fishery in the drainage. The mainstem reach on the valley floor upstream of the lake is the most popular section providing summer fishing for westslope cutthroat trout and a fall run of lake whitefish. The connected sloughs near Flathead Lake provide a mixed fishery primarily for warm water species. The North and Middle forks of the Flathead River provide diverse recreational activities and popular westslope cutthroat trout fishing.

Bull trout exhibit two life forms, with adults residing in a lake (adfluvial) or river (fluvial) and spawning in upstream tributaries. Juveniles rear in the tributaries for one to three years before migrating to adult habitats downstream. Fish move freely throughout the entire Flathead system, including all major river tributaries and lakes. The one exception is Hungry Horse Dam which cut off about 40% of the Flathead drainage. The dam prevents Flathead Lake bull trout from migrating into the South Fork of the Flathead River; Hungry Horse Reservoir now takes the place of Flathead Lake for that part of the population's life cycle. The North and Middle forks provide spawning and rearing habitat for the Flathead Lake and River population. There are other bull trout populations in other lakes and tributary systems including Whitefish Lake, Upper Stillwater Lake, Cyclone and Frozen Lakes, and lakes in Glacier National Park. Fishing regulations are very restrictive for bull trout in the Flathead drainage, where fishing for bull trout is not allowed. Major spawning tributaries (Big, Coal, Whale, Trail, Granite, Lodgepole, Morrison, and Long creeks) are closed all year to fishing. In addition, special fishing restrictions (stream mouth closures) exist on some spawning streams to protect spawning bull trout.

The larger lakes in the area contain valuable mixed non-native recreational fisheries. Ashley Lake, Little Bitterroot Lake and Lake Mary Ronan primarily provide popular kokanee salmon fisheries during both summer and winter months. Lake Mary Ronan is the kokanee egg source for the State hatchery stocking program. Echo Lake and Lake Blaine provide popular largemouth bass fisheries. With the exception of Lake Mary Ronan kokanee, these are wild self-sustaining fish populations.

Numerous small mid-elevation lakes are stocked with westslope cutthroat trout, rainbow trout or Arctic grayling providing popular put-and-grow fisheries. Lakes are stocked on a one to four year rotation to maximize fish growth or catch rates. Four family fishing ponds in the valley are heavily stocked with catchable size trout and provide many thousands of days of angling. High mountain lakes are stocked with westslope cutthroat trout.

HABITAT

Water quality is very important to Flathead Valley residents. At this time, water quality in the Flathead Lake and river system is very good, providing for drinking and municipal uses, swimming and recreation, growth and propagation of fish and associated aquatic life, and as an agricultural and industrial water supply. FWP works to protect high water quality in many ways. FWP provides input to the permitting process for a number of stream protection laws (SPA, 310) in an effort to minimize impacts and water degradation associated with human development. Biologists administer over a hundred such permits a year in the Flathead drainage.

In the North Fork of the Flathead River drainage there are a number of large coal deposits. Over the last four decades, there has been exploration of mining reserves and attempts to begin open-pit coal mining--activities that threaten water quality in the river and Flathead Lake. A recent cooperative effort between British Columbia, Montana and numerous government agencies and non-governmental groups resulted in a prohibition to mining in the North Fork of the Flathead River. This prevents future degradation of water quality and fish habitat from coal mining and other resource development.

The USFS and FWP have completed stream habitat restoration improvements in bull trout spawning and rearing habitat. For example, large trees have been added to several miles of Hallowat and Coal creeks to provide complex habitat to impacted stream reaches. These and other projects will improve bull trout and westslope cutthroat trout habitat in these streams.

Recent and ongoing land acquisitions in the Flathead drainage are designed to protect both terrestrial and aquatic species. Important bull trout and westslope cutthroat trout habitat are on these lands. FWP and partners have completed numerous private land conservation easements along the Flathead River, protecting miles of stream bank and many acres of riparian vegetation. This activity will help protect water quality in the Flathead drainage and important habitat and migratory routes for fish and wildlife.

The Bonneville Power Administration is required to mitigate for the construction and operation of Hungry Horse Dam on the South Fork of the Flathead River, and accomplishes much of this by funding the FWP mitigation program. In 1995, FWP, the Bonneville Power Administration and the BOR constructed a selective withdrawal structure on the dam. This structure pulls water from various depth levels in the reservoir to provide natural water temperatures to the Flathead River downstream. Prior to construction the dam released cold water from the bottom of the reservoir that significantly reduced stream temperatures in the Flathead River for 49 miles downstream. Restoring natural temperatures improved conditions for fish and aquatic insects. This group of agencies also implemented a dam water release strategy to more closely mimic the natural river annual flow regime. The dam is now operated to not only provide flood protection and energy production but also maintain flows in the river downstream similar to those prior to dam construction.

FISHING ACCESS

There are more than 14 publicly owned or managed access sites along the Flathead River downstream of the confluence of the North and Middle forks. There are more than 15 publicly owned or managed access sites along the North and Middle forks. There are more than 20 publicly owned or managed access sites and six privately owned access sites along Flathead Lake. Some access sites are located near local communities and, in addition to river access, provide convenient land-based recreation opportunities. Most of the river and lake access points provide boat launching opportunities, docks, bathroom facilities and parking. FWP will continue to pursue opportunities to increase access on popular water bodies, such as Flathead Lake and Whitefish Lake, where user numbers are increasing to levels above the capacity of existing sites and on water bodies where no public access currently exists such as Lake Blaine.

SPECIAL MANAGEMENT ISSUES

Flathead Lake and River Fisheries Co-Management Plan

The Confederated Salish and Kootenai Tribes (CSKT) and Montana Fish, Wildlife and Parks share fisheries management authority on Flathead Lake and River. In 2000, the two co-managers completed a fisheries management plan with goals to protect native fish by reducing non-native fish with an emphasis on sport harvest, provide recreational angling, and protect high water quality in the watershed. The management plan expired in 2010 but continues to guide management activities. CSKT is currently preparing an EIS to explore additional means to reduce lake trout abundance and increase native fish abundance. Co-managers will continue to manage fisheries and develop management plans in the future.

Westslope Cutthroat Hybridization

Pure westslope cutthroat populations within the interconnected Flathead drainage are threatened by hybridization with rainbow trout. Hybrids have shown both increased abundance and distribution in recent decades. FWP is investigating methods to prevent rainbows and hybrids from spawning, remove hybrids as feasible and to change fishing regulations to allow and even encourage anglers to harvest hybrid trout.

Illegal Fish Introductions

Illegal fish introductions are a continuing problem in Montana with more than half of the documented 600+ introductions occurring in northwest Montana. Illegal introductions impact both native and recreational fisheries, reduce fishing opportunity and increase management costs. As a disincentive to further illegal introductions, fishery managers will look to potential alternatives such as to either prohibit harvest on panfish or not provide management such as fishing limits on game fish such as pike, bass and walleye in selected waters, depending on the situation and species involved.

FISHERIES MANAGEMENT DIRECTION FOR FLATHEAD RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Flathead River - Headwaters downstream to confluence with Flathead Lake including the North and Middle Forks, and Sloughs	198 Miles	Bull trout	Wild	Conservation	Continue yearlong angling closures for all fish on primary bull trout spawning streams and closure on angling for bull trout in the Flathead River and Forks.
		Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Eliminate harvest and maintain or expand populations for conservation and catch and release westslope cutthroat angling. Consider isolation of westslope cutthroat populations if hybridization is a threat and habitat is sufficient to allow persistence.
		Mountain whitefish	Wild	General	Maintain numbers. Begin to understand population size and trend.
		Lake whitefish, Northern pike, Yellow perch, Lake trout, Brook trout, Rainbow trout, Black crappie	Wild	General/ Suppression	Provide angling harvest opportunity to reduce numbers to help meet native species goals. Investigate removal of rainbow-cutthroat trout hybrids and rainbow trout to reduce future hybridization. Consider closing harvest on illegally introduced panfish in some waters to remove incentive for further illegal introductions.
Habitat needs and activities: Restore habitat to favor native bull trout, WCT and mountain whitefish in headwater stream reaches.					
Whitefish River, Stillwater River, Ashley Creek and Tributaries	23 miles 75 miles 47 miles plus Tributaries	Bull trout, Westslope cutthroat trout	Wild Wild	Conservation Conservation/ General	Continue yearlong closure on angling for bull trout. Maintain or expand populations of westslope cutthroat trout. Consider isolation of WCT populations if hybridization is a threat and habitat is sufficient to allow persistence. Provide angling opportunity including harvest for westslope cutthroat trout where possible.
Continued on next page		Rainbow trout, Brook trout,	Wild	General	Maintain current levels of angling harvest

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Northern pike Mountain whitefish	Wild	General	Maintain numbers. Begin to understand population size and trend.
Habitat needs and activities: Continue to manage connectivity to favor native fishes.					
Whitefish Lake, Tally Lake, Upper Stillwater Lake, Lower Stillwater Lake	3,315 acres, 1,211 acres 592 acres, 252 acres	Bull trout Westslope cutthroat trout Lake trout, Northern pike, Yellow perch, Rainbow trout, Lake whitefish	Wild Wild Wild	Conservation Conservation/ General General/Special Regulations	Continue yearlong closure on angling for bull trout. Maintain or expand populations of westslope cutthroat trout. Consider isolation of WCT populations if hybridization is a threat and habitat is sufficient to allow persistence. Provide angling opportunity including harvest for westslope cutthroat trout where possible. Provide angling harvest opportunity.
Little Bitterroot Lake, Ashley Lake	2,970 acres 2,850 acres	Kokanee Rainbow trout, Rainbow x cutthroat trout hybrid, Westslope cutthroat trout Yellow perch	Wild Hatchery/ Wild Wild	Special Regulations Put-Grow-Take/ Quality General	Evaluate harvest limits to increase the average size at harvest without noticeable reducing catch rates. Maintain kokanee egg-taking in Little Bitterroot Lake and limits to maintain over-size kokanee. Evaluate stocking and/or harvest limits to produce trophy size fish and improved angler catch rates. Continue stocking triploid Gerrard rainbow trout in Little Bitterroot Lake to produce a trophy fishery. Continue hybrid trout hatchery on Ashley Lake to increase abundance. Provide angling harvest opportunity
Echo Lake, Lake Blaine	695 acres 382 acres	Kokanee	Hatchery/ Wild	Put-Grow-Take	Evaluate stocking and/or harvest limits to optimize angler catch rate.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Continued on next page		Rainbow trout	Hatchery	Put-Grow-Take	Evaluate stocking and/or harvest limits to optimize angler catch rate and assess stocking success.
		Largemouth bass	Hatchery	Special Regulations	Provide angling harvest opportunity. Maintain bass regulations on Echo Lake to protect spawning fish and an abundant bass population.
		Yellow perch, Northern pike	Wild	General	Provide angling harvest opportunity
Small Valley Floor lakes	Each less than 350 acres	Largemouth bass, Yellow perch, Northern pike	Wild	General	Provide angling harvest opportunity.
		Westslope cutthroat trout, Rainbow trout, Brook trout, Grayling	Hatchery/Wild	General/Put-Grow-Take	Evaluate stocking and/or harvest limits to optimize angler catch rate. Complete EA to assess feasibility of stocking brook trout in selected closed basin lakes for recreational fishery.
Small mountain lakes	Each less than 350 acres	Westslope cutthroat trout, Rainbow trout, Brook trout, Grayling	Hatchery/Wild	Put-Grow-Take/General	Evaluate stocking rates to provide a range of fish sizes and catch rates.
Family Fishing Ponds - Pine Grove, Shady Lane, Dry Bridge, Buffalohead	Each less than 5 acres	Westslope cutthroat trout, Rainbow trout	Hatchery	Put- Take/ Family Fishing	Provide angling harvest opportunity for youths and families emphasizing high catch rates and convenient access to urban areas.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Flathead Lake Continued on next page	123,000 acres	Bull trout Westslope cutthroat trout Lake whitefish, Northern pike, Yellow perch, Lake trout, Rainbow trout	Wild Wild Wild	Conservation Conservation/ Special regulations General/suppression	Continue yearlong closure on angling for bull trout. Eliminate harvest and maintain or expand populations for conservation and catch and release cutthroat angling. Provide angling harvest opportunity to reduce numbers to help meet native species goals. Coordinate with CSKT on lake trout management.
Lake Mary Ronan, Hubbart Reservoir	1513 acres 480 acres	Westslope cutthroat trout, Rainbow trout Kokanee Yellow perch	Hatchery Hatchery Wild	Put-Grow-Take Put-Grow-Take/ Special Regulations General	Evaluate stocking and/or harvest limits to improve angler catch rate. Evaluate stocking and/or harvest limits to optimize size of fish and angler catch rate. Maintain wild brood population in Lake Mary Ronan to provide kokanee for MT waters. Provide angling harvest opportunity and reduce impacts on other game fish.

UPPER CLARK FORK RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Upper Clark Fork River drainage lies near the heart of western Montana, and extends from its headwaters near Butte downstream to the mouth of Flint Creek.. The drainage includes the uppermost segment of the Clark Fork River and its tributaries, including Silver Bow Creek, Warm Springs Creek, and the Little Blackfoot River. The Clark Fork River begins at the junction of Silver Bow and Warm Springs Creeks, near the small community of Warm Springs. From its headwaters, the river flows northwesterly for approximately 70 miles through Deer Lodge, Powell, and Granite Counties. The Upper Clark Fork is bordered throughout much of its length by the Garnet Mountains to the north and east and the Flint Range to the south and west. The first 40 miles of the river meander through the flat plains of the Deer Lodge Valley where agriculture is the primary land use. Downstream from the mouth of the Little Blackfoot River, the Upper Clark Fork enters a narrow canyon. In this area the river channel has also been shortened by highway and railroad construction activities. However, downstream of Jens the river moves away from the transportation corridor and begins to meander downstream to its confluence with Flint Creek.

There are 76 lakes and reservoirs in the drainage, totaling 4,468 surface acres. Most natural lakes are mountain lakes in the Anaconda-Pintler and Flint Mountain Ranges. These lakes range in size from less than an acre to over 75 acres. A number of these lakes have been fitted with dams to increase storage capacity for downstream agricultural and industrial water users. The largest reservoirs in the drainage are the Warm Spring Settling Ponds, which are located near the beginning of the Clark Fork River, and Silver Lake, which is located at the head of the Warm Springs Creek drainage not far from the community of Anaconda.

FISHERIES MANAGEMENT

Located in the west-central part of the state, the Upper Clark Fork has a long history of mining related impacts that have negatively affected the fishery and aquatic resources along much of the river. This has led to the stream being one of the more underutilized rivers in western Montana. However, ongoing environmental cleanup by the State and the U.S. Environmental Protection Agency, as well as a diversity of recreational opportunities, has contributed to an increase in the Upper Clark Fork's popularity in recent years.

The Upper Clark Fork River is managed as a wild trout fishery, emphasizing natural reproduction. The basin is also the focus of native fish recovery efforts, particularly in the Little Blackfoot, Warm Springs and Silver Bow drainages. The Upper Clark Fork is home to ten native fish species including bull trout, westslope cutthroat trout, mountain whitefish, longnose and largescale sucker, northern pike minnow, peamouth, longnose dace, reidside shiner, and Columbia slimy sculpin. Nonnative fish species with widespread distribution in the Upper Clark Fork include brown trout, rainbow trout, and brook trout. Nonnative lake trout and kokanee salmon can also be found in Silver Lake and Georgetown lakes, respectively. Dominant fish species vary from westslope cutthroat and brook trout in the headwaters, to brown trout in the Clark Fork River and the lower reaches of valley-bottom tributary streams.

Bull trout are very rare in the mainstem of the Upper Clark Fork River above Flint Creek. The species is primarily isolated in the Warm Springs Creek drainage near Anaconda. Bull trout historically occurred in other drainages such as the Little Blackfoot and Racetrack Creek, but fish are rare to absent in these areas at present. Most of the populations in the Warm Springs Creek drainage appear to be genetically isolated from these other drainages, with little intermixing occurring. Fluvial forms are rare. Adfluvial forms exist in Silver and Twin Lakes. Resident forms exist in most of the larger tributaries upstream of Anaconda including Barker, Foster, Twin Lakes, and Storm Lake Creeks.

Westslope cutthroat trout are present in many of the tributary streams in the Upper Clark Fork. Angling restrictions and habitat improvements in the Little Blackfoot and Silver Bow drainages have sought to improve westslope cutthroat numbers in these areas in particular. Many of the cutthroat populations in the Upper Clark Fork show little to no hybridization with introduced rainbow trout. Additionally, fluvial forms still remain in a number of locations. While westslope cutthroat trout are relatively uncommon in the mainstem of the Upper Clark Fork River, the species does provide a unique fishing opportunity in a river largely dominated by brown trout. Information is lacking on the abundance and life histories of mountain whitefish and non-game native fishes. Efforts are needed to describe these and monitor trends.

Angling in the Upper Clark Fork River occurs year-round and is most popular in the early spring, summer and fall. Opportunities exist for both wade and float angling and while fly-fishing is particularly popular, use of artificial lures and bait fishing are also common.

Lowland ponds and reservoirs provide valuable recreational fisheries. The Warm Springs and Job Corp Ponds are stocked primarily with rainbow trout, but westslope cutthroat trout and brown trout are also planted into some waters. Warm Springs Pond #3 is a popular location where anglers go to pursue trophy-sized trout. Racetrack Pond and the Kids Pond at the Warm Springs Wildlife Management Area are both stocked with rainbow and/or westslope cutthroat trout and have special fishing regulations that seek to provide quality angling opportunities for youth anglers.

A number of high mountain lakes are stocked with westslope cutthroat trout. Lakes currently planted on a regular basis include Alpine, Alibicaulis, Little Racetrack, and Upper and Lower Barker Lakes. Other lakes are planted on a more irregular basis depending on need, while other lakes are kept fishless to help conserve amphibian populations.

HABITAT

The Upper Clark Fork Basin has a long history of human disturbance beginning in earnest in the mid 1800s when placer mining for gold began on many basin streams. By 1896, copper had become the target metal and mining and smelting operations near the town of Butte, located near the headwaters of the Clark Fork, were processing thousands of tons of copper ore per day. Mining and smelting activities in the Butte and Anaconda areas continued into the early 1980s, and while some mining activity still persists near Butte to this day, most of the operations have now been completely shut down and abandoned. Nevertheless, the environmental consequences of over 100 years of large scale mining activity in the Upper Clark Fork Basin have left their mark. Enormous amounts of fine material, mostly mine tailings, were released into the drainage,

and were transported and deposited downstream. These tailings, containing heavy metals, proved toxic to aquatic life and negatively altered the aquatic biological community of the upper river.

For years, the Upper Clark Fork River was considered void of fish. It wasn't until efforts were made to retain and prevent the downstream movement of some portion of the toxic tailings in the Warm Springs Treatment Pond System that water quality improved to a level where trout could begin to re-colonize the lower sections of the river, upstream of Missoula. However, by that time, most of the trout in the river were nonnative species, including rainbow and brown trout. Brown trout have been shown to have a higher tolerance to metals and degraded habitat conditions than other trout species, and it is likely because of this that the species dominates the current trout community in much of the Upper Clark Fork River. While trout are fairly common in the upper river today, past research has shown that trout populations are only one fifth of what would be expected without contamination from mining wastes.

The Clark Fork River from its headwaters to the former Milltown Dam site was designated a Superfund Priority Site in 1986. While cleanup activities have been underway for a number of years on Silver Bow Creek near Butte as well as at Milltown Dam near Missoula, active remediation is only just beginning on the mainstem Clark Fork River. Cleanup of metals-contaminated soils along the Upper Clark Fork River is expected to improve water quality and allow for more tolerable conditions for fish and other aquatic life.

Other factors that affect habitat quality in the Upper Clark Fork include mid-summer dewatering. Irrigation withdrawal can have severe impacts on summer stream flows in the river upstream of Deer Lodge, especially during drought years. Low flows increase water temperatures to levels not suitable for trout, and extensive algae and aquatic plant growth impact dissolved oxygen levels along much of the river.

FISHING ACCESS

In the Upper Clark Fork above Flint Creek, there are relatively few FWP-owned or managed fishing access sites. Designated fishing access sites are located at Kohrs Bend upstream of Garrison, as well as on the lower Little Blackfoot River. There are additional public properties that serve as river and stream access, but these lands are not specifically managed for fishing access. Examples are MDT and county bridge crossings, DNRC and USFS ownership.

Regulations prohibit float fishing in the segment of the Clark Fork River from its beginning to the Perkins Lane Bridge, a distance of approximately three miles.

SPECIAL MANAGEMENT ISSUES

In recent years, recreational use of the Upper Clark Fork River has increased steadily. This is likely due to significant press related to ongoing and future efforts to restore the river's health from the devastating effects of mining contaminants on the river for more than a century. While much of the work still needs to be accomplished, the desire for a clean river to recreate on is apparent. Planning efforts by the Department of Justice (Natural Resource Damage Program), FWP, and others are underway to hopefully address the need for additional fishing access sites in the Upper Clark Fork.

FISHERIES MANAGEMENT DIRECTION FOR UPPER CLARK FORK RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Silver Bow Creek and Tributaries	25 miles mainstem plus tributaries	Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Eliminate harvest and enhance fluvial populations for conservation and catch-and-release angling. Promote connectivity among tributary populations.
		Brook trout, Rainbow trout, Brown trout	Wild	General	Manage for the recovery of westslope cutthroat trout by continuing to allow liberal harvest of nonnative trout. Consider other options to reduce nonnative trout numbers if options are practical and would increase native trout density.
Habitat needs and activities: Clean up of mining contamination throughout reach. Increase instream flow and enhance habitat to support ecosystem function and production of native trout. Improve water quality of Butte Metro Sewage Treatment Plant discharge. Install a barrier on the mainstem (just below German Gulch) to prevent colonization of brown trout and rainbow trout, and allow for a westslope cutthroat trout fishery to develop.					
Warm Springs Creek and Tributaries	30 miles mainstem plus tributaries	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Enhance migratory and resident populations for conservation.
		Westslope cutthroat trout	Wild	Conservation	Preserve existing genetics in currently isolated resident populations. Improve migratory populations for angling and conservation.
		Brown trout, brook trout, Rainbow trout	Wild	General	Manage for harvest opportunity and reduce numbers to lessen competition, hybridization with, and predation on native trout. Above Meyers Dam, consider other options to reduce numbers if options would increase native trout density and WCT angling opportunity.
Habitat needs and activities: Clean up of mining contamination downstream of Anaconda. Secure instream flow and enhance habitat to support ecosystem function and production of trout and whitefish. Manage connectivity to favor native trout, particularly bull trout.					
Silver Lake	300 acres	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Enhance adfluvial population for conservation.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Continued on next page		Westslope cutthroat trout	Wild	General	Enhance population for conservation and to provide angling opportunity.
		Rainbow trout, Brook trout, Lake trout	Wild	General	Allow liberal harvest to reduce competition and hybridization with, and predation on native trout. Consider other options to reduce numbers if options would increase native trout density and WCT angling opportunity.
Habitat needs and activities: Better public access needed. Manage connectivity with Storm Lake Creek to favor adfluvial bull trout moving upstream to spawn. Pursue leasing or purchasing stored water to supplement Warm Springs Creek and the Clark Fork River.					
Clark Fork River Headwaters Downstream to Confluence with Flint Creek.	70 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue yearlong closure on angling for bull trout. Enhance migratory populations for conservation. Enhance catch-and-release westslope cutthroat trout fishery.
		Brown trout, Rainbow trout, Brook trout	Wild	Quality/ Special Regulations	Manage harvest to support quality angling opportunity. Ensure adequate connectivity with important spawning tributaries to provide for natural recruitment.
Habitat needs and activities: Clean up mining contamination throughout reach. Enhance instream flow. Enhance connectivity with tributaries where appropriate. Protect and improve habitat quality in spawning and rearing areas to enhance natural recruitment of wild and native trout and whitefish.					
Warm Springs and Job Corps Ponds	897 acres	Rainbow trout, Brown trout, Westslope cutthroat trout (species not present in all ponds)	Hatchery	Quality/ Put-Grow-Take	Restrict trout harvest and manage stocking densities to promote quality catch-and-release angling opportunity for large trout.
Habitat needs and activities: Improve water quality of ponds. Slow eutrophication process by improving water quality of Butte Metro Sewage Treatment

Plant discharge. Understand the effects of stored contaminants on the biota in and downstream of the Warm Springs Ponds.					
Racetrack Pond Kids Pond at Warm Springs Wildlife Management Area Gravel Pit Pond adjacent to Highway 48	45 acres	Rainbow trout, Westslope cutthroat trout	Hatchery	Family Fishing/ Put- Take/ Special Regulations	Encourage youth angling through special regulations (Racetrack Pond and Warm Springs WMA Kids Pond), or special fishing day events (Gravel Pit Pond). Manage stocking densities and trout harvest to promote quality angling opportunity for stocked trout
Little Blackfoot River and Tributaries	50 miles mainstem plus tributaries	Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Eliminate harvest and conserve and enhance migratory and resident populations for conservation and catch-and-release angling. Consider isolation of local populations only if hybridization or competition is a threat and habitat and fish numbers are sufficient to allow persistence.
		Brown trout, Brook trout, Rainbow trout	Wild	General/Suppression	Manage for harvest opportunity and reduce numbers to lessen competition and hybridization with, and predation on native trout, particularly above Elliston where westslope cutthroat trout are abundant. Consider other options to reduce numbers if they would increase native trout density and angling opportunity.
Habitat needs and activities: Protect and improve habitat to support ecosystem function and natural production of native trout and whitefish. Manage connectivity to favor native trout.					
Tributaries to Upper Clark Fork River Above Confluence with Flint Creek, Other Than Those Specifically Listed	---	Westslope cutthroat trout	Wild	Conservation	Enhance populations for conservation and recruitment to the Clark Fork River sport fishery. Maintain currently isolated (or consider isolating) populations only if hybridization or competition is a threat and habitat is sufficient to allow persistence. Preserve connectivity with streams currently connected to allow for maintenance of migratory life histories. Monitor these populations closely for hybridization and/or competition threats.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Brown trout, Rainbow trout, Brook trout	Wild	General	In streams with westslope cutthroat trout, continue to allow liberal harvest to reduce competition, hybridization and predation. Consider other options to reduce numbers if options and would increase native trout numbers and angling opportunity. Where native species concerns are not present, enhance migratory populations to improve recruitment to recreational fishery in the Clark Fork River.
Habitat needs and activities: Protect and improve habitat to support ecosystem function and natural production of trout. Manage connectivity to favor native trout.					

CLARK FORK RIVER FLINT/ROCK DRAINAGE

GENERAL DESCRIPTION

The Clark Fork Flint/Rock Creek drainage includes three distinct sub-drainages: Flint Creek, Rock Creek, and the section of the Clark Fork River from its confluence with Flint Creek to its confluence with the Blackfoot River. At the mouth of Flint Creek near the town of Drummond, the Clark Fork flows through a wide valley with the surrounding lands used primarily for agriculture. A few miles downstream, the Clark Fork Valley narrows and the river in this reach is confined by the I-90 Interstate and the railroad. Below the mouth of Rock Creek near the town of Clinton, the Clark Fork Valley widens again, allowing the river to flow more freely with less impact from transportation corridors, until it reaches the mouth of the Blackfoot River.

Flint and Rock Creeks are major tributaries to the Clark Fork River. Flint Creek enters the Clark Fork River near the town of Drummond. Flint Creek Dam impounds North Fork Flint Creek and forms Georgetown Lake, a hydropower reservoir, about 9 miles south of Philipsburg. Below Flint Creek Dam, the creek flows through agricultural lands used primarily for cattle and hay production. Water diverted from Flint Creek is a major source of water used for irrigation in the drainage. Rock Creek enters the Clark Fork River approximately 5 river miles upstream of the town of Clinton and 34 river miles downstream of Drummond. The headwaters of Rock Creek begin at the Continental Divide with mainstem Rock Creek beginning at the confluence of three major tributaries: Middle Fork Rock Creek, Ross Fork Rock Creek and West Fork Rock Creek. From its headwaters, Rock Creek flows approximately 52 river miles to its confluence with the Clark Fork River. The USFS is the primary land owner in the drainage, although significant portions of the valley bottom is owned by private landowners in the upper and lower reaches of the drainage.

There are 46 natural lakes and reservoirs, totaling 4,468 surface acres, in the Flint-Rock drainage including many mountain lakes. The largest flatwater body is Georgetown Lake which impounds North Fork Flint Creek and is approximately 2,080 surface acres. East Fork Reservoir is the next largest flatwater body and impounds East Fork Rock Creek. The reservoir serves as storage for irrigators in the Flint Creek Valley. A majority of the water stored in reservoir is diverted into the Flint Creek Canal just below the reservoir and delivered to irrigators in the Flint Creek Valley via a trans-basin diversion into Trout Creek, a tributary of Flint Creek. This water is used by irrigators throughout the Flint Creek Valley, but most of the water users are located in the lower Flint Creek drainage and gain access to the water via the Allendale diversion and ditch. Mountain lakes can be found throughout the Rock Creek drainage but the majority is found in the headwaters of the drainage, including several in the Anaconda Pintler Wilderness. The Flint Creek drainage also has many mountain lakes with the highest density being in the Flint Mountain Range.

FISHERIES MANAGEMENT

Clark Fork River

The portion of the Clark Fork River in the Flint-Rock Creek drainage has a long history of mining- related impacts associated with mining and smelting operations in the Butte and Anaconda area. These operations negatively impacted the river's fishery resources and have led to this river being one of the more underused rivers in western Montana.

The Clark Fork River is managed as a wild trout fishery, emphasizing natural reproduction. The Upper Clark Fork is home to ten native fish species including bull trout, westslope cutthroat trout, mountain whitefish, longnose and largescale sucker, northern pikeminnow, peamouth, longnose dace, redbelt shiner, and sculpin (*Cottus* spp.). Nonnative fish species inhabiting the Upper Clark Fork include brown trout, rainbow trout, and brook trout. Brown trout are the primary recreational fish in the Clark Fork River downstream of Flint Creek, although westslope cutthroat trout and rainbow trout are also common. Information is lacking on the abundance and life histories of mountain whitefish and non-game native fishes. Efforts are needed to describe these species and monitor their trends.

Bull trout and westslope cutthroat trout are at low densities in the mainstem of the Clark Fork River downstream of Flint Creek. Spawning and rearing streams for bull trout include Harvey Creek, Boulder Creek, and Rock Creek and its tributaries. Westslope cutthroat trout are found in several tributaries to this section of the Clark Fork. Densities of cutthroat are lower in the mainstem reach from Flint Creek to Bearmouth than downstream of Bearmouth. Many westslope cutthroat trout populations are found in tributaries to the Clark Fork River below Flint Creek. Some of these tributaries are physically and biologically connected to the mainstem and help with maintaining the fluvial population in the river. Others tributaries have barriers and block the return of adults to their natal streams. However, these barriers do protect the tributary populations from introgression with rainbow trout and rainbow/westslope cutthroat trout hybrids, and prevent colonization by nonnative species.

Angling occurs year-round on the Clark Fork River but is most popular in the early spring, summer and fall. Opportunities exist for both wade and float angling and while fly-fishing is the most popular form of use, artificial lures and bait fishing are also common. Beavertail Pond provides a flatwater fishing opportunity and attracts a significant amount of angling pressure. Beavertail pond is managed as a put-and-take trout fishery for kids and family fishing.

Flint Creek

Flint Creek is a major tributary to the Clark Fork River that serves as an important recreational fishery. Fishing pressure is not as high as found in other important recreational fisheries in the area including Rock Creek, Georgetown Lake and the Clark Fork River. Poor public access to much of Flint Creek is one reason for the low fishing pressure.

Flint Creek is managed as a wild trout fishery, emphasizing natural reproduction. Brown trout are the most abundant salmonid and are the primary recreational fish. Native westslope cutthroat and bull trout are present in the drainage, however bull trout are only found in the Boulder Creek drainage and mainstem Flint Creek. Westslope cutthroat trout are found in the mainstem and in many tributaries of Flint Creek. Several westslope cutthroat trout populations in the drainage are

protected from hybridization with rainbow trout by fish passage barriers. The largest genetically-pure population is located in the Lower Willow Creek drainage, above Lower Willow Creek Dam. Other native fish species found in the Flint Creek Drainage include mountain whitefish, largescale and longnose suckers, northern pikeminnow, longnose dace, reidside shiner, and sculpin (*Cottus* spp.). Nonnative fish species present in the drainage include brown, rainbow, and brook trout. Information is lacking on the abundance and life histories of mountain whitefish and non-game native fishes. Efforts are needed to describe these species and monitor their trends.

Georgetown Lake is the largest flatwater body in this drainage and is one of the most popular trout fisheries in the state. It is managed as a put-and-grow fishery for rainbow and brook trout and as a wild kokanee salmon fishery. Georgetown Lake routinely ranks in the top 10 in Montana for angling pressure and is equally as important as both a summer and winter ice-fishing destination. Irrigation and flood control are other uses of Georgetown Lake that influence water management in this system.

Other lakes stocked in the Flint Creek drainage include Lower Boulder Lake, Stewart Lake and Echo Lake. Both Stewart and Echo Lakes can be accessed by road while Lower Boulder is a back country lake. Many other high mountain lakes in the Flint Creek drainage provide fisheries but are sustained by natural reproduction. Several other lakes in the drainage are fishless and will likely be managed as fishless in the future to provide habitat to conserve other native populations (e.g., amphibians).

Rock Creek

Rock Creek is one of twelve renowned “Blue Ribbon” rivers in Montana and is one of the state’s most popular rivers for recreation. The river’s exceptional fish populations and abundant public land (allowing for excellent public access), combined with its proximity to Missoula, contribute to its popularity.

Rock Creek is managed as a wild trout fishery, emphasizing natural reproduction and is also a stronghold for native bull trout and westslope cutthroat trout. Other native fish species found in the drainage include mountain whitefish, largescale and longnose suckers, northern pikeminnow, longnose dace, and sculpin (*Cottus* spp.). Nonnative fish species present in the drainage include brown trout, rainbow trout, brook trout, and grayling. Brown trout provide a majority of the sport fishery in the Rock Creek drainage, although westslope cutthroat are abundant in the upper mainstem and also provide an excellent fishery. Rainbow trout once provided a majority of the recreational fishery throughout the drainage until whirling disease became prevalent and their numbers decreased in the early 1990s. Rainbow trout are still abundant in the lower portion of the drainage and provide a significant recreational fishery, although their densities are much lower now than was observed before whirling disease. The decline in rainbow trout densities is even more pronounced in the upper drainage where they now make up only a small portion of the fishery. Brown trout have increased throughout the mainstem and replaced rainbow trout as the most abundant salmonid. Information is lacking on the abundance and life histories of mountain whitefish and non-game native fishes. Efforts are needed to describe these species and monitor their trends.

Bull trout are found throughout mainstem Rock Creek and comprise a large meta-population with fish moving throughout the drainage to complete their life history. This population also contributes bull trout to the Clark Fork River. Spawning and rearing tributaries are found throughout the drainage with most of the stronger populations located closer to the headwaters. The largest bull trout population in the drainage is found in East Fork Reservoir. This population is an adfluvial population that uses East Fork Rock Creek for spawning and rearing and juveniles eventually outmigrate to the reservoir where they reside as sub-adults and adults. A large amount of spawning also occurs annually in a portion of East Fork Rock Creek routinely inundated by stored water from East Fork Reservoir. This spawning is likely a consequence of East Fork Rock Creek being intermittent approximately a half mile above the reservoir, eliminating upstream passage during summer low flow periods. The amount of recruitment that is provided to the reservoir from the inundated reach is unknown.

Westslope cutthroat trout are also found throughout the Rock Creek drainage, and similar to bull trout, are a meta-population with fish moving throughout the drainage and Clark Fork to complete their life history. Spawning and rearing tributaries are found throughout the drainage. Most tributaries in the Rock Creek drainage that maintain enough stream flow for fish to spawn and rear also sustain a westslope cutthroat trout population. Fluvial westslope cutthroat trout are found throughout the mainstem and are most abundant in the upper portion of the drainage. Rock Creek above Windlass Bridge consistently maintains high enough densities to provide an excellent recreational fishery. Westslope cutthroat trout populations in the Rock Creek drainage are well connected with very few tributaries having fish passage barriers. While this connectivity allows for gene flow between populations, very few westslope cutthroat trout populations in the drainage are protected from colonization by introduced trout and hybridization.

Angling occurs year-round and is most popular in the spring, summer and fall. Opportunities exist for both wade and float angling, although float fishing is only allowed on Rock Creek from December 1 through June 30. This regulation was put into place to allow for floating during high flows when multiple stonefly hatches are occurring, but protects wade anglers from disturbance by float anglers during low flows when most locations on Rock Creek are accessible via wading. Fly fishing is the most popular form of fishing on Rock Creek, although other artificial lures are also common. Bait fishing on Rock Creek is only allowed for anglers 14 years of age and younger.

Of the lakes and reservoirs in the Rock Creek drainage, East Fork Reservoir receives the most angling pressure. East Fork Reservoir provides an excellent put-and-grow fishery for large westslope cutthroat trout as well as a few large, wild rainbow trout. A westslope cutthroat trout stocking program was initiated for this reservoir in 2004 and has been very successful in establishing a popular recreational fishery. Other mountain lakes in this drainage provide westslope cutthroat trout fisheries, although Fuse Lake does provide a self-sustaining Arctic grayling population.

Several other lakes are stocked with fish in the Rock Creek drainage including Green Canyon Lake, Whetstone Lake and Moose Lake. Moose Lake can be accessed by road while both Green Canyon and Whetstone Lakes are back-country lakes. Many other high mountain lakes in the Rock Creek drainage provide fisheries but are sustained by natural reproduction. Several other lakes in the drainage are fishless and will likely be managed as fishless in the future to promote conservation of native aquatic communities.

HABITAT

Clark Fork River

The Upper Clark Fork Basin has a long history of human disturbance beginning in earnest in the mid 1800s when placer mining for gold began on many basin streams. By 1896, copper had become the target metal, and mining and smelting operations near the town of Butte were processing thousands of tons of copper ore per day. Mining and smelting activities in the Butte and Anaconda areas continued into the early 1980s, and while some mining activity still persists near Butte to this day, most of the operations have now been shut down and abandoned. Nevertheless, the environmental consequences of over 100 years of large scale mining activity in the Upper Clark Fork Basin have left their mark. Enormous amounts of fine material, mostly mine tailings, were released into the drainage, and were transported and deposited downstream throughout the river system. These tailings proved toxic to aquatic life and negatively altered the aquatic biological community of the upper river.

For years, the Upper Clark Fork River was considered void of fish. It wasn't until efforts were made (beginning in 1911 and later in the 1990s) to retain and stop downstream movement of a portion of the toxic tailings in the Warm Springs Treatment Pond System, that water quality improved to a level where trout could begin to re-colonize the river upstream of Missoula. By then, most of the trout in the river were rainbow and brown trout. Brown trout have been shown to have a higher tolerance to metals and degraded habitat conditions than other trout species, and is likely the reason the species dominates the current trout community in much of the Upper Clark Fork River. While trout are fairly common in the upper river today, past research has shown that trout populations are only one fifth of what would be expected without contamination from mining wastes.

The Clark Fork River from its headwaters to the former Milltown Dam site was designated a Superfund Priority site in 1986. While cleanup activities have been underway for a number of years on Silver Bow Creek near Butte as well as at Milltown Dam near Missoula, active remediation is only just beginning on the mainstem Clark Fork River. Cleanup of metals-contaminated soils along the Upper Clark Fork River is expected to improve water quality and allow for more tolerable conditions for fish and other aquatic life. The reach of the Clark Fork downstream of Rock Creek has better water quality because of the addition of water from Rock Creek.

Other factors that affect habitat quality in the Upper Clark Fork include mid-summer dewatering. Irrigation withdrawal can have severe impacts on summer stream flows in the river upstream of Deer Lodge, especially during drought years. These factors likely affect habitat conditions in the Clark Fork River below Flint Creek through the cumulative impacts of high water temperatures and poor water quality. Surprisingly, trout densities are lower in the reach from Flint Creek to the mouth of Rock Creek than are observed in the reaches above and below. It is unknown what causes this reduction. The factors that limit the fish populations in the reach are unclear. Extensive channelization from the development of I-90 and two railroads has significantly reduced sinuosity and extensively altered natural alluvial processes in this reach. These activities have significantly changed the fish habitat in this reach and may potentially impact fish populations. Trout densities do improve substantially again below the mouth of Rock Creek.

Flint Creek

Agriculture and mining have played a significant role in the history of the Flint Creek Valley. Currently, the majority of land use in the Flint Creek drainage is agriculture with a focus on cattle and hay production. Flint Creek below the Allendale diversion is significantly dewatered during irrigation season which is likely the primary limiting factor for fish populations in the reach, particularly during drought years. Dewatering does not appear to be a major factor on Flint Creek above the Allendale diversion due to abundant water being delivered from East Fork Rock Creek into the Flint Creek drainage. Fish entrainment into diversion ditches also occurs throughout the drainage which also impacts fish populations in most reaches of Flint Creek. Other impacts of agriculture on Flint Creek include riparian grazing that reduces woody riparian vegetation and decreases channel stability. Mining has also significantly impacted fish habitat conditions in the Flint Creek Valley with several tributaries displaying mining-related habitat degradation including Lower Willow Creek, Douglas Creek (near Hall), Henderson Creek, Douglas Creek (near Philipsburg), Fred Burr Creek and North Fork Flint Creek.

Habitat conditions in Georgetown Lake are also a significant concern in the Flint Creek drainage. Georgetown Lake is a shallow, productive reservoir which allows it to produce excellent rainbow trout, brook trout and kokanee salmon fisheries. However, these factors also create conditions that can be detrimental to these fisheries. Georgetown Lake is a high elevation (6,400 ft) reservoir that maintains ice cover for an extended period of time; typically from early November through mid-May. During the winter, there is minimal diffusion of oxygen into the lake due to ice and snow cover, along with significant consumption of oxygen due to the decomposition of macrophytes and detritus along the substrate. Over the course of the winter, the combination leads to significant depletions of oxygen throughout the water column, creating poor habitat conditions for the trout and salmon in the lake. These conditions can be exacerbated if water levels are drawn down too low during the previous year's operation. Thus, water management at Georgetown Lake via Flint Creek Dam operations is critical to providing adequate water to avoid poor water quality and maintaining healthy trout and salmon fisheries.

Rock Creek

The Rock Creek drainage maintains excellent fish habitat and water quality, largely due to the extensive public land ownership in the drainage which is generally managed to provide quality fish and wildlife habitat. The upper portion of the Rock Creek drainage is largely managed for livestock ranching. Impacts to fish populations in this portion of the drainage include irrigation withdrawal and the associated entrainment of fish and also reduced riparian over-story vegetation. The middle portion of the drainage (Windlass Bridge to the mouth of Welcome Creek) is nearly entirely owned by the USFS and the habitat in this reach is in excellent condition with the main impact being a riparian road that is adjacent to the creek through much of this reach. The lower portion of Rock Creek below Welcome Creek is again primarily privately owned in the valley bottom with a majority of the land use being residential subdivisions. Temperature monitoring in the drainage indicates that water temperatures are as high at Windlass Bridge (river mile 37.5) as are observed near the mouth of the drainage (river mile 0). This indicates that impacts to the fishery that cause increased temperature are greatest in the upper portion of the drainage and improve lower in the drainage. It is suspected that the reduction in irrigation, improvement in riparian habitat conditions, and supply of cold water from

tributaries in the middle reach of the drainage improves water temperatures and overall fish habitat.

The conservation value of Rock Creek has long been recognized by FWP and the citizens of western Montana. Thus, several land conservation projects have been completed in the upper portion of the drainage, mostly in the form of conservation easements. These projects include several large ranches that provide contiguous habitat with some of the easements requiring protective management of the riparian habitat. Future projects that protect additional parcels in both upper and lower Rock Creek should be high priority, particularly if they are adjacent to existing conservation easements. FWP also has a Murphy Water Right on Rock Creek which protects a minimum base flow in the river, although it is rarely necessary to exert this right due to the private ranching acreage being relatively small in the drainage.

FISHING ACCESS

Public access on the Clark Fork River from Flint Creek to the mouth of the Blackfoot River is currently relatively good. Fishing access sites owned by FWP on the Clark Fork River are located near Drummond, Bearmouth, Beavertail, Clinton (Schwatz Creek FAS), Turah, and Bonner (Milltown Dam State Park). The Milltown Dam State Park near Bonner is currently in the developmental phase but will be open to public use in the near future. A BLM-owned fishing access site is also available to anglers near mile marker 7 on the Drummond frontage road between Drummond and Bearmouth. In addition, there are several undeveloped sites along the Clark Fork River in this reach that are currently used by anglers, but access is not guaranteed due to private ownership. Beavertail Pond is another site owned by FWP in this reach that provides access for flatwater fishing for kids and families. While public access is currently good in this reach, additional planning efforts are underway to improve access further including potential funding from the Department of Justice (Natural Resource Damage Program--NRDP) for acquisition of properties and improvements to current sites.

There are currently no FWP-owned or managed fishing access sites on Flint Creek. One access point has recently been improved by FWP through a cooperative agreement with a private landowner, but access is at the discretion of the landowner. The only other public access to Flint Creek currently is the use of public lands such MDOT and county bridge crossings, DNRC ownership, etc. FWP has initiated discussions with the local watershed group to work on improving access on Flint Creek, but very few projects have been identified. Planning efforts by the NRDP and FWP are underway to provide funding for development of accesses on Flint Creek, should the opportunity arise. Fishing access is abundant on Georgetown Lake including the Stuart Mill Fishing Access Site owned by FWP and multiple access sites owned by the USFS.

Fishing access in the Rock Creek drainage is excellent. The entire middle portion of the drainage is owned and managed by the USFS allowing for open access to anglers and recreationalists. Several fishing access sites are also present in the lower portion of the drainage including parcels of public land, developed fishing access sites and multiple access points via the Rock Creek Road right-of-way. Overall, very few stretches of the lower and middle reaches of Rock Creek are inaccessible to anglers willing to hike and wade. Access to Upper Rock Creek is somewhat more difficult due to the extensive private land ownership. However, FWP has recently leased one site in this reach and is in the process of developing another site for public access. Public

land in-holdings and conservation easements negotiated to allow public access also provide access for anglers to the upper drainage.

SPECIAL MANAGEMENT ISSUES

Social Conflicts on Rock Creek

The primary social conflict present in Rock Creek is float fishing. Several residents in upper Rock Creek would like to see float fishing either more regulated or shifted to other parts of the drainage. Some wade anglers also support either limiting or eliminating float fishing in Rock Creek due to floaters making it difficult to wade fish. The current regulations which limits float fishing from December 1- June 30 prevents a majority of the conflict between wade anglers and float anglers, as most floaters are using the river during high flows when it is difficult to wade. Nonetheless, there will always be some parties that are dissatisfied with floating on Rock Creek.

Fishing derbies have occasionally been proposed on Georgetown Lake and consistently opposed by sportsman's groups and lake homeowners for the past couple of decades. Typically the only proponent of these contests has been the applicant. FWP proposes that derbies no longer be allowed on Georgetown Lake.

FISHERIES MANAGEMENT DIRECTION FOR CLARK FORK RIVER - FLINT/ROCK DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Clark Fork River (Flint Creek Mouth-Blackfoot River Mouth) and Tributaries	52 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue yearlong closure on angling for bull trout. Enhance migratory populations for conservation. Enhance catch-and-release westslope cutthroat trout fishery.
		Brown trout, Rainbow trout	Wild	Quality/ Special Regulations	Manage harvest to support quality (1000 trout/mile) angling opportunity.
		Brook trout	Wild	General	Maintain liberal harvest limits to support native species goals by reducing competition and hybridization.
Habitat needs and activities: Continue efforts to clean up mining contamination in upper portion of the drainage. Enhance in-stream flows where possible and improve riparian habitat and grazing management where appropriate. Protect and improve habitat quality in spawning and rearing areas to enhance natural recruitment of wild and native trout. Gain a better understanding of factors limiting trout populations in reach between the mouth of Flint Creek and the mouth of Rock Creek.					
Flint Creek	41 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Enhance fluvial populations of WCT for conservation and angling.
		Rainbow trout, Brown trout,	Wild	Quality	Manage trout harvest to support quality angling opportunity.
		Brook trout	Wild	General	Maintain liberal harvest limits to support native species goals by reducing numbers and competition and hybridization.
Habitat needs and activities: Enhance in-stream flows below Allendale Diversion. Reduce fish entrainment particularly below the mouth of Boulder Creek. Improve riparian habitat and grazing management throughout the drainage.					
Georgetown Lake	2,080 acres	Rainbow trout	Wild/ Hatchery	Put-Grow-Take	Manage trout harvest and stocking to support quality angling and liberal harvest opportunity.
Continued on next page		Brook trout	Wild	Quality/ Put-Grow-Take /Special Regulations	Maintain current natural reproduction and supplement with hatchery fish to provide adequate fish densities for anglers. Implement harvest limits and stocking rates that provide for quality sized fish.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Kokanee salmon	Wild	Special Regulations	Maintain liberal harvest limits to attain quality sized fish and high angler catch rates.
		All species	N/A	N/A	Prohibit fishing contests to reduce social conflicts with other anglers.
Habitat needs and activities: Continue to work with dam operators to maintain sufficient over-winter pool elevations and improve other dam operations to minimize the impact chronic low winter dissolved oxygen levels have on fish populations.					
Boulder Creek	14 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Enhance migratory and resident populations of WCT for conservation and angling.
		Brown trout, Rainbow trout, Brook trout	Wild	General	Allow liberal harvest to reduce numbers and lessen hybridization and competition with native trout. Consider other options to reduce numbers if options would increase native trout density and angling opportunity.
Habitat needs and activities: Minimize entrainment of fish into diversion ditches in the lower portion of the drainage and improve riparian habitat conditions where appropriate.					
Flint Creek Tributaries- Other than Boulder Creek	36 miles	Westslope cutthroat trout	Wild	Conservation	Enhance populations for conservation. Maintain isolation of WCT populations protected by barriers to upstream fish passage if habitat and numbers are sufficient to allow persistence. Maintain connectivity to streams currently connected to allow for maintenance of migratory life histories and mainstem angling opportunities.
		Brown trout, Rainbow trout, Brook trout	Wild	General	Maintain liberal harvest and consider measures that reduce their abundance in reaches protected by a barrier or in reaches considered native species strongholds. Enhance rainbow and brown trout populations that provide recruitment to Flint Creek or the Clark Fork River and are not located in reaches with abundant native trout
Habitat needs and activities: Improve riparian habitat conditions and reduce fish entrainment particularly in reaches that maintain native trout populations or important migratory non-native trout populations. Improve in-stream flows in reaches that are currently dewatered and support clean-up efforts in drainages with mining impacts.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Harvey Creek	15 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Enhance migratory and resident life histories for conservation and westslope cutthroat trout angling. Maintain barrier to protect populations from invasion by brown trout and rainbow trout.
		Rainbow trout, Brown trout	Wild	General	Allow liberal harvest. Consider other options to reduce numbers if options would increase native species numbers and angling opportunity.
Habitat needs and activities: Continue to improve riparian habitat via grazing management. Reduce entrainment of outmigrating fish and potentially implement selective upstream fish passage for bull trout at the barrier near the mouth.					
East Fork Reservoir and East Fork Rock Creek above Reservoir	370 acres and 5 miles	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout and enhance adfluvial populations for conservation.
		Westslope cutthroat trout	Wild/ Hatchery	Put-Grow-Take/ Quality	Manage for harvest opportunity of quality sized fish. Evaluate stocking to determine return to creel and assess expansion of population in upstream tributaries
		Rainbow trout, Brook trout	Wild	General	Allow liberal harvest. Consider other options to reduce numbers if options would increase native trout density and angling opportunity.
Habitat needs and activities: Work to maintain minimum reservoir levels to improve overwinter habitat conditions and reduce entrainment of bull trout through the dam. Assess improving surface water flow in East Fork Rock Creek above East Fork Reservoir to improve access for bull trout to upstream spawning habitat, should feasible methods arise.					
East Fork Rock Creek- Below East Fork Dam	8 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Enhance fluvial and resident populations for conservation.
		Brown trout, Rainbow trout, Brook trout	Wild	General	Allow liberal harvest. Consider other options to reduce numbers if options would increase native trout density and WCT angling opportunity.
Habitat needs and activities: Reduce native fish entrainment by screening the Flint Creek Main Canal. Improve habitat conditions below the reservoir by improving in-stream flows and maintaining periodic flushing flows. Improve riparian habitat and reduce entrainment of native fish where appropriate.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Rock Creek	62 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue yearlong closure on angling for bull trout. Enhance fluvial populations of WCT for conservation and angling.
		Rainbow trout	Wild	Quality/Special Regulations	Maintain catch-and-release regulations in attempt to improve numbers while recognizing that whirling disease is likely the primary limiting factor.
		Brown trout	Wild	Special Regulations	Maintain liberal harvest regulations to allow for harvest opportunity and reduce numbers to lessen competition with and predation on native trout.
Habitat needs and activities: Continue efforts to protect private lands via conservation easements and land acquisition. Improve riparian habitat and grazing management in drainage where appropriate. Reduce entrainment of native and wild fish into irrigation ditches.					
Rock Creek Tributaries		Bull trout, Westslope cutthroat trout	Wild	Conservation	Continue yearlong closure on angling for bull trout. Enhance fluvial and resident populations of WCT for conservation and angling.
		Brown trout, Rainbow trout, Brook trout	Wild	General	Allow liberal harvest. Consider other options to reduce numbers if options would increase native trout density and WCT angling opportunity.
Habitat needs and activities: Improve riparian habitat where appropriate and reduce entrainment of native fish where necessary.					
Tributaries to the Clark Fork River (Other Than Harvey Creek, Flint Creek and Rock Creek)		Westslope cutthroat trout	Wild	Conservation	Enhance migratory and resident populations for conservation and angling. Maintain isolation of populations protected by barriers if habitat and fish abundance are sufficient to allow persistence. Maintain connectivity to streams currently connected to allow for migratory life histories and mainstem angling.
		Rainbow trout, Brown trout,	Wild	General	Maintain liberal harvest and consider measures that reduce their abundance in reaches protected by a barrier or in reaches

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Brook trout			considered native species strongholds. Enhance rainbow and brown trout populations that provide recruitment to the Clark Fork River and are not located in reaches with abundant native trout.
Habitat needs and activities: Improve degraded riparian habitat particularly in stream reaches where native salmonids are present. Reduce fish entrainment particularly at locations where native fish are routinely entrained.					

BLACKFOOT RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Blackfoot River begins at the junction of Beartrap and Anaconda Creeks, located near the Continental Divide between Rogers Pass and Flesher Pass. From its headwaters, the river flows westward for 132 miles through Lewis and Clark, Powell, and Missoula Counties, draining a 2,290 square mile basin to Bonner, where it joins the Clark Fork River. The Blackfoot watershed includes 9,000-foot peaks in the headwaters, flows through heavily forested slopes, montane foothills before entering rangelands and prairie pothole topography on the valley floor. Major tributary drainages include the North Fork of the Blackfoot River and Clearwater River. The North Fork begins in the Scapegoat Wilderness, flowing much of its length through a glaciated mountain valley and a steep confined canyon within the USFS boundary. As it enters the floor of the Blackfoot valley, the North Fork flows through a more agricultural setting, bordered by private land, before entering the Blackfoot River at river-mile 54. The Clearwater watershed is comprised of a peripheral network of forested freestone, coldwater streams which lie primarily on public lands and enter an interconnected chain of glacial lakes on the valley floor. Land ownership is mixed along the valley floor, with private lands concentrated near the town of Seeley Lake.

There are 59 natural lakes totaling 5,720 acres and one large reservoir of 350 acres within the Blackfoot Drainage. Most natural lakes are mid- and high elevation “mountain” lakes that lie in remnant glacial cirques and troughs within public land holdings in backcountry settings. However, many of the larger natural lakes make up the Clearwater River chain and glacial potholes in the Ovando area. Large natural lakes include Salmon, Placid, Seeley, Alva, Inez, Rainy, Browns and Upsata Lakes. All of the larger valley floor lakes receive considerable angling pressure as well as other recreational activities. The only major reservoir is Nevada Reservoir near Helmville, which is managed primarily for irrigation purposes. Nevada Reservoir experiences considerable drawdown during dry years.

FISHERIES MANAGEMENT

Located in the west-central part of the state, the Blackfoot River is one of twelve renowned “Blue Ribbon” rivers in Montana with an instream flow (Murphy) water right and is one of Montana’s most popular rivers for recreation. The river’s outstanding natural resources and diversity of recreational opportunities, combined with its proximity to Missoula, contribute to its popularity. The Clearwater River watershed is the largest tributary to the Blackfoot River in terms of drainage area and is often treated as a separate system with its own unique natural resource values.

The Blackfoot River is managed as a wild trout fishery, emphasizing natural reproduction of free-ranging and naturalized nonnative trout. The basin is also a focus for native trout recovery efforts. The Blackfoot River basin is home to eleven native fish species including bull trout, westslope cutthroat trout, mountain whitefish, pygmy whitefish, peamouth, northern pikeminnow, longnose dace, redbreast shiner, longnose and largescale suckers, and two species of sculpin. Fourteen nonnative fish species inhabit the Blackfoot Basin including brown trout,

brook trout, rainbow trout, Yellowstone cutthroat trout, Arctic grayling, kokanee salmon, northern pike, fathead minnow, brook stickleback, central mudminnow, pumpkinseed, largemouth bass, yellow perch and white sucker. Dominant fish species and species composition vary greatly among headwater reaches, lakes and mainstem river sections. During the last 20 years westslope cutthroat trout have increased from <3% of the trout community to over one-third of the mainstem river trout community. Much of this increase has occurred since 1990, when basin-wide catch-and-release regulations were instituted and major aquatic restoration activities began. Information is lacking on the abundance and life histories of non-game native fishes. Efforts are needed to describe these and monitor trends.

Bull trout are found throughout the drainage, and particularly within the larger, coldest stream systems. Migratory bull trout move freely throughout the entire Blackfoot mainstem and rely on the larger colder tributaries including the North Fork Blackfoot, Monture and Copper Creeks for reproduction and rearing. Similarly, adfluvial (lake-dwelling) bull trout occupy the chain of lakes in the Clearwater system and spawn in tributaries such as Morrell Creek and East and West forks of the Clearwater River. Juvenile bull trout also occupy many of the smaller, colder tributaries throughout the Blackfoot drainage, where these streams are connected to larger bull trout strongholds. Both westslope cutthroat trout and bull trout have been the focus of basin-wide protection and restoration activities for over 20 years. Protection activities include special fishing regulations (e.g., stream mouth closures, gear restrictions), as well as public land acquisitions and conservation easements in native trout habitat. Restoration projects, such as instream improvements, fish passage enhancements, fish screening, and water leases have been undertaken throughout the basin in order to help recover bull trout, westslope cutthroat trout and other species. This work has occurred on both private and public land.

Angling occurs year-round on the Blackfoot River, but is most popular in the early spring, summer and fall. Opportunities exist for both wade and float angling and while fly-fishing is particularly popular, artificial lures and bait fishing are also common. Angling restrictions and habitat improvement have significantly improved native trout numbers in the Blackfoot basin. Long-term studies show native trout recovery has been most effective in the mid- to upper Blackfoot basin upstream of the Clearwater River. Because of this, habitat improvements in the Blackfoot River drainage below the Clearwater River should emphasize ecosystem function for all salmonids, including bull trout in streams like Gold and Belmont creeks. Native salmonids in the lower Blackfoot basin should be protected, or enhanced where possible.

Natural lakes in the Clearwater Valley offer diverse fishing opportunities and strongholds for native fish. Upper drainage lakes, including Clearwater, Rainy, Alva, Marshall, and Inez, support coldwater fisheries for westslope cutthroat trout, kokanee, and whitefish. Although brown trout, brook trout and small populations of warmwater fish are also present in these waters, management emphasizes native trout and kokanee. Lower drainage lakes in the Clearwater chain (Seeley, Placid and Salmon Lakes) provide mixed fisheries. Although illegally introduced northern pike are abundant in Seeley and Salmon lakes, these lakes still provide viable salmonid fisheries and important habitat for migratory bull trout populations. Placid Lake, the warmest and most productive lake in the area, supports nonnative salmonids, largemouth bass and yellow perch fisheries. Bull trout in Placid Lake are not present or are in extremely low numbers.

Lowland lakes such as Harpers, Upsata, Coopers and Browns Lake also provide valuable recreational fisheries. Harpers and Browns Lakes are stocked annually with rainbow trout and

both support heavily used put-and-grow fisheries. Rainbow trout in Browns Lake exhibit outstanding growth and this lake supports one of the few trophy rainbow trout fisheries in the region. Upstata Lake is prone to periodic fish kills and is managed as a warmwater bass fishery partially supported by the stocking of largemouth bass. Coopers Lake is a low elevation oligotrophic lake managed as a put-and-grow cutthroat trout fishery.

Mountain lakes largely support self-sustaining trout populations or are stocked with westslope cutthroat trout in some instances. An exception is Heart Lake, which is stocked with both Arctic grayling and westslope cutthroat trout. Several lakes in the backcountry support self-sustaining, naturalized rainbow trout and these include Parker, Twin, Otatsy and Camp Lakes. Canyon Lake, located in the upper North Fork drainage, supports genetically pure adfluvial native westslope cutthroat trout. Several high elevation lakes, as well as glacial potholes on the Blackfoot valley floor are managed as fishless and thereby emphasize the conservation of other native species (e.g., amphibians).

HABITAT

The Blackfoot River Basin has a long history of habitat protection, river restoration and riparian habitat conservation emphasizing native fish. These activities occur basin-wide and typically focus on altered tributary streams. To date, riparian habitat improvements have occurred on more than 50 tributaries. Projects typically involve livestock management changes, fish passage enhancement, augmenting instream flows, screening irrigation ditches and planting riparian vegetation. These types of activities usually involve cooperating private landowners, conservation groups (e.g., Trout Unlimited) and natural resource agencies.

The Blackfoot River basin contains about 165 miles of dewatered stream on 46 tributaries, most of which is the result of irrigation. A drought plan was developed for the Blackfoot River beginning in 2000 to help offset low-flow impacts to fisheries. This plan calls for angler restrictions and river closures in the summer when flows drop below 700 cfs at Bonner, which corresponds with FWP's 1973 Murphy Water right. If junior water users have a cooperative and effective water conservation plan, their junior water right is not subject to call.

Recent and ongoing land acquisitions and conservation easements have been completed throughout the Blackfoot drainage. The most recent acquisition and easement actives are part of the "Montana Working Forests Project", which includes large transfers of former Plum Creek Land to conservation-minded private landowners, FWP and other natural resource agencies. Two recent examples include the North Chamberlain Project and the Marshall Creek Wildlife Management Area, both of which are specifically designed to protect both fish and wildlife species. In addition, prior conservation easements have been placed on private lands throughout the Blackfoot valley in areas that support critical bull and westslope cutthroat trout habitat. These easements focus on the Ovando Valley but are expanding into the Nevada, Clearwater and Lincoln valleys as well. As of 2012, over 125,000 acres of private land are protected from development pressure under perpetual conservation easements. Where possible, FWP will continue to promote landscape protections in native fish habitat.

Low flows can limit floating opportunities above the confluence of the mainstem and North Fork during certain times of the year. Below the confluence, opportunities for float recreation are available most of the year during normal flows.

The Montana Department of Environmental Quality classifies the Blackfoot as a B-1 stream, meaning the river should be maintained for activities such as drinking and municipal uses, swimming and recreation, growth and propagation of trout and associated aquatic life, and as an agricultural and industrial water supply.

Water quality in the Blackfoot watershed is generally high with only slight or no impairment. However, lower Nevada Creek (located in the middle basin) and the Mike Horse Mine area (located in the very headwaters of the Blackfoot River) are exceptions. Nevada Creek is prone to dewatering and water quality problems due to intensive agricultural activities. The Mike Horse area is contaminated by elevated metals concentrations due to the release of mine wastes from the adits and tailings and the 1974 failure of the Mike Horse tailing dam, which further contaminated the upper Blackfoot River with toxic waste. Water quality degradation is also a concern in the Clearwater chain-of-lakes area due to human development and intensive land use. Elevated nutrient levels and eutrophication are a concern in Seeley, Salmon and Placid Lakes at the lower end of the system where impacts of human use are magnified.

FISHING ACCESS

There are more than 30 publicly owned or managed access sites along the Blackfoot River and numerous others at lakes and streams across the watershed. Some access sites are located near local communities and, in addition to river or lake access, provide convenient land-based recreation opportunities. Public access sites on lakes are largely managed by either FWP or the USFS, depending on land ownership. Within the Blackfoot River Recreation Corridor (27 miles from Russell Gates FAS to Johnsrud Park FAS), the public is allowed to access the lower Blackfoot River via private land (up to 50 ft above the ordinary high water mark) through a cooperative agreement with private landowners. This access agreement supplements existing public access sites within the corridor. FWP also manages BLM sites along the Blackfoot River through a cooperative management agreement. The FAS program also must consider how location, development and use of access sites affect recreational use on the water and the social experience under guidance from the Blackfoot River Recreation Management Plan of 2010. Another priority is to pursue opportunities for extended float trips using existing access sites for boat camps.

SPECIAL MANAGEMENT ISSUES

Social Conflicts on the Blackfoot River

A recreation management plan was developed for the Blackfoot River in 2010 for the purpose of addressing social conflicts on the river and at access sites. The plan guides management of conflicts between user groups, congestion on the water and at access sites, littering and other resource impacts associated with high concentrations and volume of use, and behavior of users.

FISHERIES MANAGEMENT DIRECTION FOR BLACKFOOT RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Blackfoot River and Tributaries (Headwaters Downstream to Confluence with Clearwater River)	90 miles of mainstem and Connected Tributaries	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue to manage for no harvest of riverine populations of native trout and manage for a high quality WCT angling opportunity. Consider isolation of WCT populations only if hybridization or competitive displacement clearly threatens the persistence of local populations.
		Rainbow trout, Brown trout	Wild	Special Regulations	Allow liberal harvest. Consider management that reduces numbers and distribution if it would improve native trout numbers and WCT angling opportunities.
		Other introduced game fish (e.g., Yellow perch, Northern pike, Brook trout)	Wild	General/ Special Regulations	Manage for liberal harvest and contain distribution where possible.
Critical habitat needs: Clean-up of Mike Horse Mine area in headwaters of the Blackfoot River. Restore habitat to favor native salmonids based on established native trout priority streams.					
Nevada Reservoir	350 acres	Westslope cutthroat trout	Hatchery	Put-Grow-Take/ Quality	Manage for high catch rates and quality-sized fish
		Yellow perch	Wild	General	Liberalize harvest and contain distribution
Coopers Lake	200 acres	Westslope cutthroat trout	Hatchery	Put-Grow-Take/ Quality	Manage for high catch rates and quality sized fish.
Browns Lake	530 acres	Rainbow trout	Hatchery	Put-Grow-Take	Manage for trophy rainbow trout and quality harvest opportunities with high catch rates

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
North Fork Blackfoot River, Monture and Copper/Landers Fork Drainages	70 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue closure for intentional angling of bull trout and enhancement of angling opportunity for WCT. Consider reintroductions of native WCT in the streams and lakes in the Wilderness area of the North Fork upstream of the North Fork Falls. Consider converting Yellowstone cutthroat trout to westslope cutthroat trout in Big Horn Lake in the Landers Fork drainage.
		Brown trout	Wild	Special regulations	Maintain liberal harvest opportunity to reduce expansion and impacts on other trout. Consider management that reduces numbers and distribution if it would improve native trout numbers and angling opportunities.
		Rainbow trout	Wild	Special regulations	Maintain numbers at present levels.
Lake Upsata	91 acres	Largemouth bass	Hatchery	Quality	Provide for a high quality largemouth bass angling though stocking and restrictive regulations.
Clearwater River and Tributaries	50 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/Special Regulations	Conserve and enhance migratory and stream-resident populations. Continue protective regulations to prohibit bull trout harvest and limit WCT harvest.
		Brown trout Brook trout	Wild	Special Regulations	Provide liberal harvest opportunities. Consider management that reduces numbers and distribution if it would improve native trout numbers and WCT angling opportunities.
		Kokanee salmon	Hatchery/ Wild	General	Manage for quality harvest opportunities with high catch rates; evaluate relative contribution of wild & stocked fish
		Yellow perch, Largemouth bass, Northern pike, Pumpkinseed	Wild	General/ Special regulations	Provide liberal harvest opportunity and reduce numbers where possible to reduce competition with and predation on trout and salmon.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

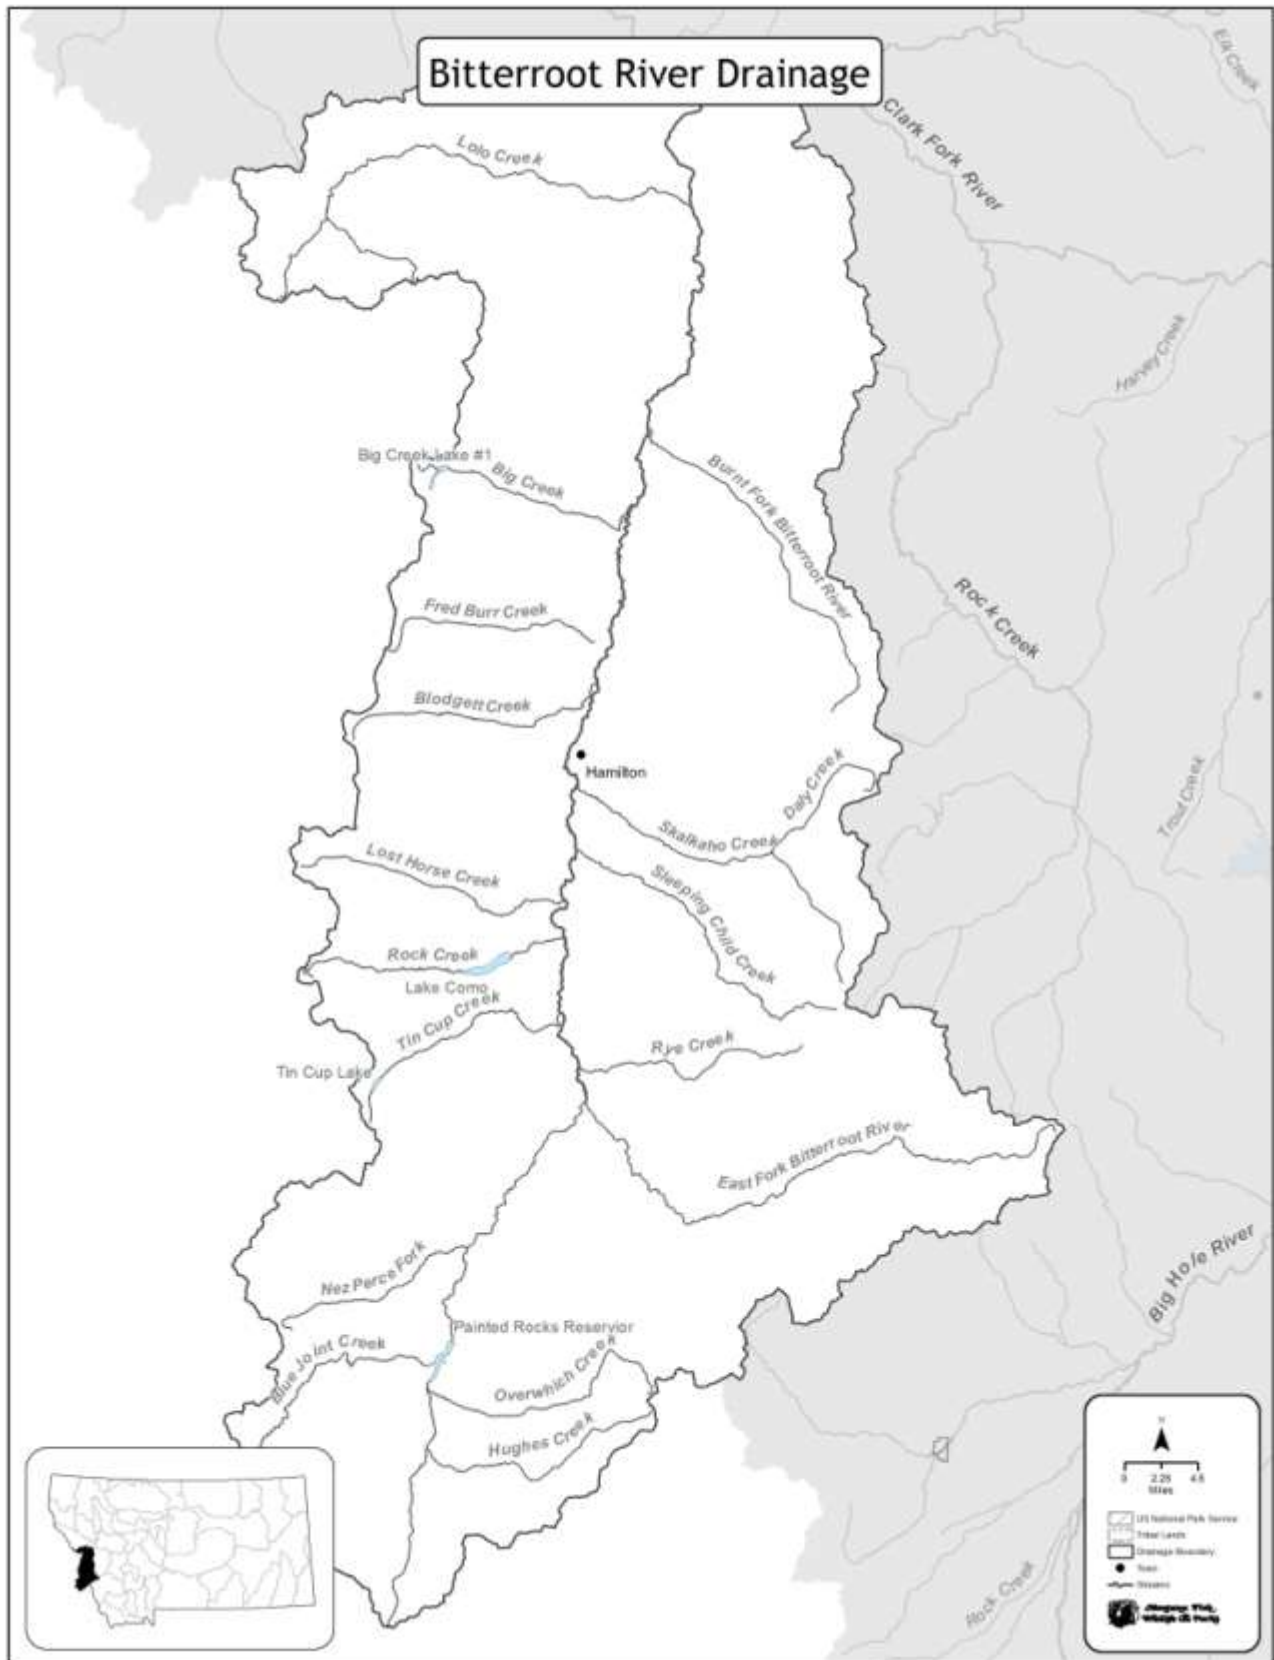

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Habitat needs and activities: continue to manage connectivity to benefit native fishes. Improve quality of tributary habitat.					
Clearwater, Rainy, Alva, Marshall and Inez Lakes	878 acres	Bull trout	Wild	Conservation	Conserve and enhance migratory populations. Continue protective regulations to prohibit angler harvest.
		Westslope cutthroat trout	Wild	Put-Grow-Take/ Quality	Manage for quality sized fish and high catch rates. Evaluate relative contributions of wild and stocked fish; evaluate performance and feasibility of sterile stocked fish.
		Kokanee salmon	Wild/ Hatchery	Put-Grow-Take/ Special Regulations	Evaluate stocking to optimize number stocked, size of fish, and catch rates; evaluate relative contribution of wild & stocked fish.
		Brook trout, Brown trout	Wild	General	Provide liberal harvest opportunity and reduce numbers where possible to reduce predation on and competition and hybridization with native trout.
		Yellow perch, Largemouth bass, Pumpkinseed	Wild	General/ Special Regulations	Provide liberal harvest opportunity and reduce numbers where possible to reduce competition with and predation on trout and salmon.
		Northern pike	Wild	Special Regulations/ Suppression	Emphasize harvest to reduce predation on trout; derbies are required to harvest fish. Explore other harvest means such as angler incentives and commercial methods that would need legislative approval.
Seeley Lake and Salmon Lakes	1,707 acres	Westslope cutthroat trout	Hatchery/ Wild	Put-Grow-Take	Evaluate stocking to determine success to creel and effects on endemic populations of westslope cutthroat trout. Consider stocking sterile fish after evaluation of performance.
Kokanee salmon		Wild/ Hatchery	Put-Grow-Take/ Special Regulations	Evaluate stocking to optimize number stocked, size of fish and angler catch rate; evaluate relative contribution of wild & stocked fish.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Bull trout	Wild	Conservation	Conserve and enhance migratory populations. Continue protective regulations to prohibit angler harvest.
		Brown trout Brook trout	Wild	General	Provide liberal harvest opportunity to reduce competition and hybridization with and predation on native trout. Consider measures to reduce number if native trout numbers and angling opportunity would increase.
		Largemouth bass	Wild	Special Regulations	Maintain existing fishery but consider liberalizing harvest opportunity
		Yellow perch, Pumpkinseed	Wild	General	Provide liberal harvest opportunity and reduce numbers where possible to reduce competition with trout.
		Northern pike	Wild	Special Regulations/ Suppression	Emphasize harvest to reduce predation on trout; derbies must harvest fish. Explore other harvest means such as angler incentives and commercial methods that would need legislative approval.
Placid Lake	1,300 acres	Bull trout	Wild	Conservation	Protect and enhance any remnant population.
		Westslope cutthroat trout	Wild/ Hatchery	Put-Grow-Take/ Special Regulations	Evaluate stocking to optimize number stocked, size of fish, and catch rates; evaluate relative contribution of wild & stocked fish
		Kokanee salmon	Hatchery/ Wild	Put-Grow-Take/ Special Regulations	Evaluate stocking to optimize number stocked, size of fish, and catch rates; evaluate relative contribution of wild & stocked fish
		Brook trout Brown trout	Wild	General	Provide harvest opportunity for anglers with liberal regulations.
		Yellow perch, Pumpkinseed	Wild	General	Provide quality harvest opportunity.
		Largemouth bass	Wild	Quality	Maintain and enhance quality of fishery through restrictive regulations.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Harpers Lake	15 acres	Rainbow trout, Westslope cutthroat trout	Hatchery	Put-Grow-Take	Manage as a quality trout harvest opportunity with high angler catch rates.
		Yellow perch	Wild	General	Maintain liberal harvest limits and reduce numbers if possible to reduce competition with trout.
Habitat needs and activities: Monitor lake water quality and eutrophication with Clearwater Resource Council. Manage lake water levels to balance instream flow needs of outlet streams.					
Blackfoot River and Tributaries (Clearwater River to Confluence with Clark Fork River)	35 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue with no harvest regulations in order to enhance fluvial populations for conservation and westslope cutthroat trout angling. Continue to maintain and enhance bull trout where practical. Continue to manage for genetically pure westslope cutthroat trout.
		Rainbow trout, Brown trout	Wild	Quality/Special Regulations	Maintain present numbers and sizes.
		Other introduced game fish (e.g., Yellow perch, Northern pike, Brook trout)	Wild	General/Special Regulations	Manage for liberal harvest and contain distribution where possible.
Habitat needs and activities: Improve habitat to support ecosystem function and production of wild trout and whitefish.					

BITTERROOT RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Bitterroot River drainage includes the Bitterroot River and its tributaries, including the East and West Forks of the Bitterroot River, Lolo Creek and their tributaries. The Bitterroot River begins at the junction of East and West Forks. It flows northward for 80 miles through Ravalli and Missoula Counties, draining a 1,891 square-mile basin to Missoula, where it joins the Clark Fork River. The Bitterroot watershed includes 9,000-foot peaks in the headwaters and heavily forested slopes, rangelands and wetlands on the valley floor. The headwaters of most of the tributaries originate on the Bitterroot National Forest. The East Fork of the Bitterroot River begins in the Anaconda-Pintler Wilderness. Tributaries of the West Fork Bitterroot River and the Bitterroot River from the west drain out of the Selway-Bitterroot Wilderness.

There are 83 natural lakes and reservoirs in the drainage, totaling 3,070 surface acres. Most natural lakes are mountain lakes in the headwaters of the Anaconda-Pintler and Selway-Bitterroot Wilderness areas. Two large reservoirs are Lake Como and Painted Rocks Reservoir. Lake Como receives considerable human use for fishing and other recreational activities. It also contributes about 3,000 acre-feet of water to the Bitterroot River each year. Painted Rocks Reservoir supplies 25,000 acre-feet of water to the Bitterroot River for instream flows and irrigation. Both Lake Como and Painted Rocks Reservoir experience considerable drawdown on an annual basis.

FISHERIES MANAGEMENT

Located in the southwestern part of the state, the Bitterroot River is very popular for recreation. The mainstem river is generally ranked with the top five in the state for fishing pressure, which generally exceeds 100,000 angler days a year. The river's outstanding natural resources and diversity of recreational opportunities, combined with its proximity to Missoula, contribute to its popularity.

The Bitterroot River is managed as a wild trout fishery, emphasizing natural reproduction. The basin is also a focus area for native fish recovery efforts. The Bitterroot River is home to 10 native fish species including bull trout, westslope cutthroat trout, mountain whitefish, northern pike minnow, longnose dace, redbelt shiner, peamouth, longnose and largescale sucker, and Columbia slimy sculpin. Nonnative fish species inhabiting the Bitterroot include brown trout, brook trout, rainbow trout, northern pike, and largemouth bass. Dominant fish species vary from westslope cutthroat in the headwaters to mountain whitefish in the Bitterroot River. Other than mountain whitefish, rainbow trout are the dominant sportfish in the mainstem of the Bitterroot River. Brown trout have increased in numbers in the East and West Forks of the Bitterroot drainage and some tributaries over the past 10 years. Coincident with the brown trout expansion is the decline of rainbow trout in the upper Bitterroot drainage. Whirling disease is believed to be the primary reason for this decline. Fishing regulations are designed to allow more harvest of brown trout in these areas. Lolo Creek is also dominated by brown trout, but transitions into brook trout and westslope cutthroat trout populations in headwater areas. Information is lacking

on the abundance and life histories of mountain whitefish and non-game native fishes. Efforts are needed to describe these and monitor trends.

Bull trout are rare in the mainstem of the Bitterroot River. Fluvial forms exist in the East and West Forks, but are also uncommon. Adfluvial lifeforms exist primarily in Painted Rocks Reservoir. Resident lifeforms exist in many smaller tributaries throughout the drainage.

Angling occurs year-round and is most popular in the early spring, summer and fall. Opportunities exist for both wade and float angling and while fly-fishing is particularly popular, artificial lures and bait fishing is also common.

Angling restrictions have improved westslope cutthroat trout numbers in the Bitterroot River upstream of Hamilton, but are less effective below Hamilton. Therefore, efforts in the Bitterroot River drainage to favor native salmonids (trout and whitefish) should be focused upstream of Hamilton. The greatest improvements for native salmonids are likely to be in tributaries or river sections where they dominate. Conversely, the Bitterroot River drainage below Hamilton should have an emphasis of restoring ecosystem function for all salmonids. Native salmonids in this area should be protected, or enhanced if possible.

Lake Como and Painted Rocks Reservoir offer some angling opportunity. Lake Como is stocked annually with catchable rainbow trout and westslope cutthroat trout. Due to the significant drawdowns and low productivity, fishing is only fair in each reservoir.

Some high mountain lakes are stocked with westslope cutthroat trout and some support wild populations of cutthroat, rainbow and brook trout. Most lakes are kept fishless to help conserve other native fauna (e.g., amphibian populations). Unstocked lakes comprise a geographic distribution and range of sizes and depths thought to help amphibian populations.

HABITAT

The Bitterroot River, particularly downstream of Hamilton, has been subject to dewatering. Prior to the early 1980's, irrigation demands significantly depleted streamflows during midsummer. Based on fisheries studies in the early 1980's and an agreement with the local irrigators and the Montana Department of Natural Resources and Conservation, water from Painted Rocks Reservoir began to be released during midsummer to supplement flows in the river. Since that time, a Bitterroot River water commissioner has been appointed each year to manage releases and withdrawals from the river to maintain minimum streamflows targeted at Bell Crossing, where a USGS gage was established. The target minimum flow of about 400 cfs at Bell Crossing is met during wet years, but not during very dry years, when streamflows can drop to below 200 cfs. In the early 1990's the dam at Lake Como was raised 3 feet and the extra stored water is released into the Bitterroot River after Labor Day each year.

Many of the tributaries of the Bitterroot River are also subject to midsummer dewatering. Efforts to restore streamflows to these streams have been difficult. Dewatering of tributaries remains one of the most serious issues for the fishery in the Bitterroot River. Rainbow and Brown trout spawn in the lower ends of these tributaries and the river. Native trout spawn in streams on the Bitterroot National Forest.

Water temperature in the Bitterroot River often exceeds 72°F in the lower reaches. During particularly warm summers, fishing restrictions have been implemented until water temperatures drop to more tolerable levels for trout.

Homes and agricultural development along the Bitterroot River have led to the need for streambank stabilization. The Bitterroot River migrates laterally long distances in some years, which endangers homes and other developments that are near the river. As a consequence, approximately 12.5% of the streambanks on the river have been stabilized, mostly to protect residential development. This is an ongoing issue due to the fact that streambank stabilization is usually disruptive of recreational uses and alters some of the natural functions of the river. More stringent regulations in recent years have slowed homebuilding within the floodplain, and have prevented some of the building of riverfront homes that are often threatened by the migration of the river.

Lolo Creek is also a stream that has been heavily impacted by bank stabilization. Much of the mainstem channel was relocated or altered during the construction of U.S. Highway 12. Conservation efforts have focused on the upper watershed. In 2010-2011, thousands of acres of corporate timberlands in the upper basin were converted to public ownership (managed by USFS) as part of the “Montana Legacy Project”.

Water quality in the Bitterroot is high with some indication of high nutrient levels in the lower river. Suspended sediment in the river is generally low, except during spring runoff when the river experiences increased turbidity. The Montana Department of Environmental Quality classifies the Bitterroot as a B-1 stream, meaning the river should be maintained for activities such as drinking and municipal uses, swimming and recreation, growth and propagation of trout and associated aquatic life, and as an agricultural and industrial water supply.

FISHING ACCESS

Fishing access to the Bitterroot River is excellent. There are 13 fishing access sites along the mainstem of the Bitterroot River managed by MFWP. In addition, there are several publicly owned or managed sites along the river that are commonly used by anglers. Along the East and West Forks of the Bitterroot River, public access is good due to the public lands managed by the Bitterroot National Forest. Some of these sites are managed as fishing access sites and others are informally used by anglers. Lolo Creek also has a number of public access sites that are managed by FWP and the USFS.

SPECIAL MANAGEMENT ISSUES

Social Conflicts on the Bitterroot River

Presently, there is no River Recreation Plan in effect for the Bitterroot River. Due to high angling pressure, there are some social conflicts. On the West Fork of the Bitterroot River, information is being collected to understand when and where conflicts occur.

FISHERIES MANAGEMENT DIRECTION FOR BITTERROOT RIVER DRAINAGE

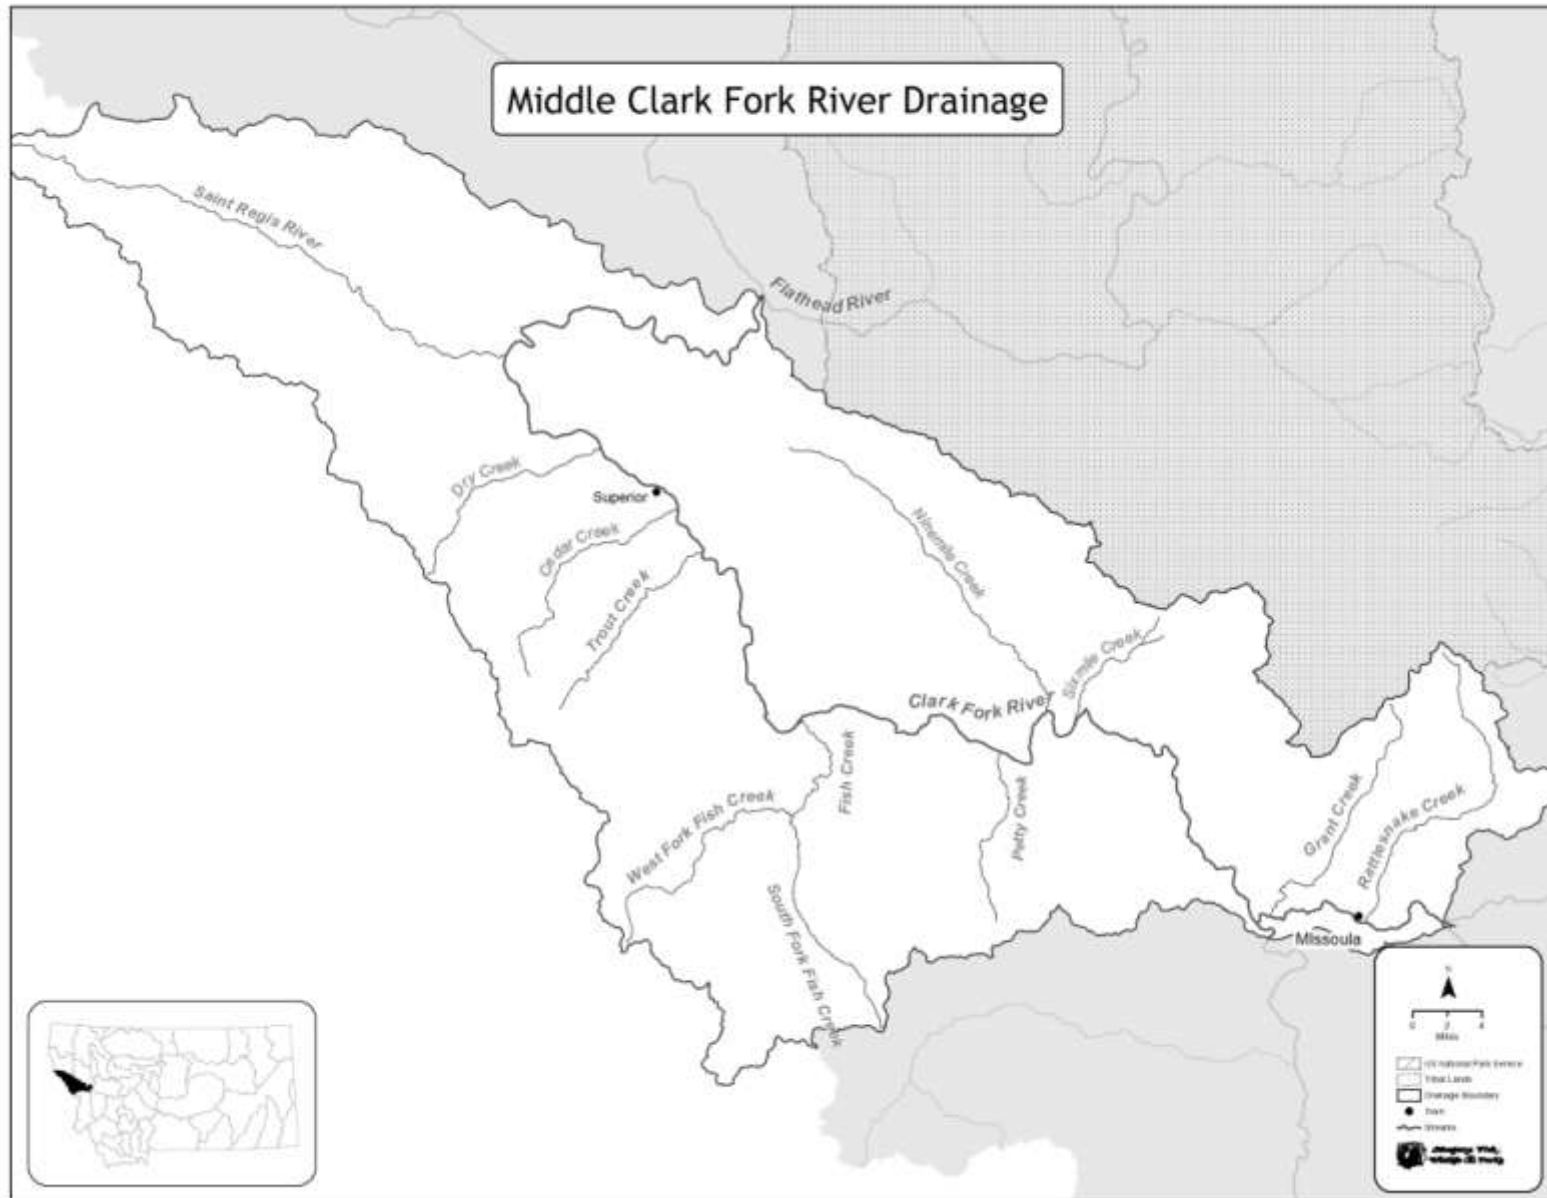

Water	Miles/acres	Species	Origin	Management Type	Management Direction
West Fork Bitterroot River and Tributaries Including Painted Rocks Reservoir	565 acres of reservoir and 42 miles of mainstem	Bull trout	Wild	Conservation	Continue yearlong closure on angling for bull trout and enhance migratory populations for conservation.
		Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Maintain or enhance numbers above present levels for conservation and angling. Investigate the genetics of the westslope cutthroat populations and possibly manage as a refuge.
		Brook trout	Wild	General\Wild	Reduce numbers to lessen competition and hybridization and help meet native trout goals.
Habitat needs and activities: Continue to manage connectivity to favor native fishes.					
East Fork Bitterroot River and West Fork Bitterroot River Below Painted Rocks Reservoir	56 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue yearlong closure on angling for bull trout and enhance migratory populations for conservation and WCT angling.
		Brown trout	Wild	Special Regulations	Maintain liberal harvest regulations to allow for opportunity to harvest brown trout and reduce competition with and predation on native trout. Consider management that reduces numbers and distribution if it would improve native trout numbers and WCT angling opportunities.
		Rainbow trout	Wild	Special Regulations	Maintain catch-and-release regulations in attempt to improve fishery while recognizing that whirling disease is likely the primary limiting factor.
Habitat needs and activities: Continue to manage connectivity to favor native fishes.					
Tributary streams To the East Fork Bitterroot River and West Fork Bitterroot River Below Painted Rocks Reservoir	>100 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Conserve and enhance migratory and resident populations. Continue yearlong closure on angling for bull trout and enhance cutthroat fishery. Consider isolation of WCT populations if hybridization is a threat and habitat and numbers are sufficient to allow persistence

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Bitterroot River - Confluence of East and West Forks downstream to Blodgett Creek Near Hamilton	30 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue yearlong closure on angling for bull trout. Enhance fluvial populations of WCT for conservation and angling.
		Rainbow trout, Brown trout	Wild	Special regulations	Maintain present numbers and sizes. Consider management that reduces numbers and distribution if it would improve native trout numbers and WCT angling opportunities.
Habitat needs and activities: Enhance habitat to favor native trout and whitefish.					
Skalkaho Creek	24 miles	Rainbow trout, Brown trout, Brook trout	Wild	General	Maintain liberal harvest opportunity. Consider management that reduces numbers and distribution if it would improve native trout numbers and angling opportunities.
		Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Protect and enhance numbers of fish. Continue yearlong closure on angling for bull trout. Enhance fluvial populations of WCT for conservation and WCT angling.
Tributary Streams to Bitterroot River (other than Skalkaho Creek) from Confluence of East and West Forks Downstream to Blodgett Creek Near Hamilton	>100 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation	Conserve and enhance migratory and resident populations. Continue yearlong closure on angling for bull trout and enhance westslope cutthroat trout fishery. Consider isolation of westslope cutthroat trout populations if hybridization is a threat and habitat and numbers are sufficient to allow persistence.
		Rainbow trout, Brown trout, Brook trout,	Wild	General	Maintain liberal harvest on and consider measures that reduce the abundance in reaches protected by a barrier or in reaches considered native species strongholds.
Lake Como	911 acres	Rainbow trout, Westslope cutthroat trout	Hatchery	Put-Grow-Take	Provide liberal harvest opportunity
Bitterroot River - Blodgett Creek to confluence with Clark Fork	50 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue yearlong closure on angling for bull trout and enhance fluvial WCT populations for conservation and WCT angling.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Rainbow and Brown trout	Wild	Special Regulations	Manage trout harvest to support quality angling opportunity.
Habitat needs and activities: Improve habitat to support ecosystem function and production of trout and whitefish. Manage water from Painted Rocks Reservoir to maintain fishery with the goal of 400 cfs to Bell Crossing.					
Tributary streams To Bitterroot River from Blodgett Creek to the Confluence with Clark Fork River	>100 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Conserve and enhance migratory and resident populations. Continue yearlong closure on angling for bull trout and enhance cutthroat fishery. Consider isolation of westslope cutthroat trout populations if hybridization is a threat and habitat and numbers are sufficient to allow persistence.
		Rainbow trout, Brown trout, Brook trout	Wild	General	Maintain liberal harvest on and consider measures that reduce the abundance in reaches protected by a barrier or in reaches considered native species strongholds. Enhance rainbow and brown trout that provide recruitment to the mainstem and are not located in reaches with abundant native trout.
Hieronymus Pond	2 acres	Rainbow trout	Hatchery	Family Fishing Pond\Put-Grow-Take	Primarily kids fishing pond. Facilitate high catch rates and quality opportunity for kids and handicapped.
		Yellow perch, Largemouth bass	Wild	General	

MIDDLE CLARK FORK RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Middle Clark Fork River drainage begins at the confluence of the Clark Fork and Blackfoot rivers at Milltown, and extends downstream for 120 miles to the mouth of the Flathead River. The river flows generally westward as it runs through Missoula, Mineral and Sanders Counties. Just downstream of the city of Missoula, the Bitterroot River enters and nearly doubles the river's discharge. Other major tributary watersheds (upstream to downstream) include Rattlesnake Creek, Grant Creek, Mill Creek, Ninemile Creek, Petty Creek, Trout Creek, Cedar Creek and the St. Regis River system. River volume roughly doubles again when the Clark Fork joins with the Flathead River near Paradise.

The main stem Clark Fork River channel is generally entrenched and stable throughout its length. The one exception is a 25 mile section through the Missoula Valley from Kelly Island (west side of Missoula) to the Ninemile Creek area (near Huson), where the river has a wide, accessible floodplain and active lateral migration. The river alternates between relatively narrow rock canyons and wider agricultural valleys as it progresses downstream. Major canyons include Hellgate Canyon (East Missoula), the Alberton Gorge (Alberton) and the "Cutoff" section between St. Regis and the Flathead River Confluence. Land ownership along the main stem is predominantly private, with scattered FWP, DNRC and USFS parcels.

Tributary watersheds include more than 50 coldwater trout streams that lie primarily on publically-owned timberlands at high and mid-elevations. As tributaries reach foothills and near the valley floor, private land ownership becomes much more prevalent. Most tributary streams are bisected by major transportation system crossings (i.e., railroad, interstate highway, frontage roads) on the valley floor before they reach the Clark Fork River. Many of these crossings on smaller streams act as complete barriers to upstream fish movement.

There are numerous high elevation "mountain" lakes within the Middle Clark Fork Basin, as well as a few constructed lakes and ponds on the valley floor. More than 120 alpine mountain lakes (> 1 acre) occur in two general areas: (1) in the Bitterroot Mountains along the Montana-Idaho divide from Alberton to Lookout Pass; and (2) within the Rattlesnake National Recreation Area and Wilderness area near Missoula. Although some have been enhanced by dams, nearly all of these waters are natural lakes formed in high glacial troughs and cirque basins. Valley ponds and small lakes (managed as public fisheries and recreation sites) are generally man-made reservoirs and reclaimed gravel pits. These include Frenchtown Pond, Kreiss Lake, Silvers Lagoon at McCormick Park and several other small water bodies.

FISHERIES MANAGEMENT

Located in the west-central part of the state, the middle Clark Fork River is a large system that runs through a major population center (Missoula) and developed valleys downstream. Although the fishery is not as renowned as in some of its major tributaries (e.g., Rock Creek, Blackfoot River, Bitterroot River), the middle Clark Fork River supports a popular trout fishery. This system has gained national notoriety in the past decade with the removal of Milltown Dam, clean-up of river contaminants at its upper end, and anticipated recovery of fishery resources.

The middle Clark Fork River is managed as a wild trout fishery, emphasizing natural reproduction. Although native bull trout (low numbers) and westslope cutthroat trout (moderate numbers) are present throughout all reaches, the river fishery is dominated by non-native rainbow trout, rainbow x westslope cutthroat trout hybrids and brown trout. Rainbow trout and their hybrids generally make up 70-80% of the trout population within this river section. Brown trout are found in moderate densities in the Missoula area, but generally decrease in abundance in lower reaches. Mountain whitefish are common throughout the mainstem river section.

In addition to salmonids, the Middle Clark Fork is home to eight other native fish species including peamouth, northern pikeminnow, longnose dace, redbelt shiner, longnose sucker, largescale sucker, and two species of sculpin. Ten non-native fish species are also common in various parts of the basin, including brown trout, brook trout, rainbow trout, Yellowstone cutthroat trout, northern pike, pumpkinseed, largemouth bass, smallmouth bass, yellow perch and white sucker. Prior to removal of Milltown Dam and Milltown Reservoir, northern pike were becoming more prevalent in the Clark Fork River. The reservoir served as a primary spawning and rearing area for this species, which then dispersed downstream and occupied the mainstem river in significant numbers. Since removal of the dam, northern pike numbers have declined and are no longer considered a major threat to salmonids populations. More recently, smallmouth bass densities have increased dramatically in the lower Flathead River. However, no major colonization of the Clark Fork River upstream of the Flathead River confluence has been detected.

Tributary stream drainages support a range of abundant, resident trout species and are essential for spawning and rearing of fluvial (river-migratory) trout that reside in the mainstem river. Species composition varies greatly among tributaries and, in many streams, changes along a continuum from headwaters to mouth. Larger tributaries are generally “open” to fish movement with the Clark Fork, and are dominated by rainbow/cutthroat trout hybrids and brown trout. From the mainstem, species composition typically transitions to westslope cutthroat trout in an upstream direction, with pockets of brook trout also occurring in many transition areas and warmer tributaries. Smaller tributary systems and those at higher elevations are generally dominated by westslope cutthroat trout. Many of these populations are protected from hybridization with rainbow trout by artificial fish barriers associated with the extensive valley transportation system (e.g., road culverts, railroad tunnels).

The coldest remaining systems with suitable habitat still support viable bull trout populations, including Rattlesnake Creek, Fish Creek, Cedar Creek, and portions of the St. Regis River. The Fish Creek drainage supports the most intact habitat and abundant native trout populations within the middle Clark Fork region. These few remaining bull trout populations provide a limited amount of bull trout recruitment to the Clark Fork River where densities are 1-2 adults per mile in most reaches.

Although nearly all of the >100 mountain lakes in the basin were historically fishless, roughly 45% now support trout populations. Many still contain self-sustaining, wild populations of brook trout, westslope cutthroat trout, rainbow trout, and Yellowstone cutthroat trout that were introduced in the mid-1900s. Most of these lakes are no longer stocked, but many others with limited natural reproduction are stocked periodically with westslope cutthroat trout. Management of stocked lakes ranges from high density, frequently planted waters designed for high catch rates to infrequently stocked, low density trophy waters. A large number of fishless lakes are also

maintained to preserve natural ecological integrity (e.g., for conservation of native amphibians such as the long-toed salamander and spotted frogs). Management strategies and information for all mountain lakes in the basin are described in recent plans available from the FWP Region 2 office in Missoula.

Angling occurs year-round on the middle Clark Fork River, but is most popular in the early spring, summer and fall. Opportunities exist for both wade and float angling and while fly-fishing is particularly popular, artificial lures and bait fishing are also common. Special fishing regulations have been instituted to protect spawning fish, native fish strongholds and staging areas, and to retain the quality of trout fisheries – despite increasing fishing pressure. Summer and fall also offer excellent angling opportunities on tributary streams and mountain lakes.

Valley lakes and ponds provide popular put-and-grow trout fisheries that are accessible for most of the year. The waters are stocked frequently and offer opportunities for high catch rates and liberal harvest. All of these fisheries are geared to kids fishing and family-friendly environments with easy access.

HABITAT

The middle Clark Fork River is considered a recruitment-limited fishery where enhancing spawning access for wild fish and improving the quality of tributary habitats has been a priority for the past decade. Restoration and improvement efforts have occurred throughout the watershed, but have focused on native fish strongholds. Fish passage improvements, riparian restoration projects, instream enhancements, fish screens, etc., have involved a number of partners on both public and private lands. As the largest land manager in the basin, the USFS has undertaken many activities on their lands associated with fish passage and the forest road system. In addition, key land acquisitions have been completed in tributary drainages to protect spawning and rearing habitat. Notable projects include public acquisition of more than 50,000 acres to form the Fish Creek Wildlife Management Area and purchase of more than 5 miles of riparian corridor on Cedar Creek. Numerous other conservation easements and smaller acquisitions have been completed by public and private organizations throughout the basin.

River and stream dewatering from irrigation is generally not a significant limiting factor in the basin, particularly when compared with neighboring river systems. However, legacy impacts of historic mining and timber management (roads) remain significant factors degrading habitat quality on a large scale and in many tributary drainages. Restoration and remediation activities addressing these impacts will likely be a priority in the future that will be led by the USFS, Trout Unlimited, FWP and other partners.

FISHING ACCESS

There are more than 15 publicly owned or managed access sites along the river. Some sites are located near local communities and, in addition to river access, provide convenient land-based recreation opportunities. The section of the Middle Clark Fork River between St John's FAS and Forest Grove FAS (Alberton Gorge), is a popular stretch of river for scenery, whitewater and angling with much of the riverfront in that section owned by FWP. The Alberton Gorge is managed by FWP's Parks Division. Overall, public access opportunities along the Middle Clark Fork are good with no urgent needs for additional access.

SPECIAL MANAGEMENT ISSUES

Habitat and Water Quality Issues

Over the past decade, a tremendous amount of resources have been invested in the removal of Milltown Dam, remediation of river contaminants, and restoration of the Clark Fork River. Monitoring of river habitat, water quality, and fish and aquatic populations will be essential in evaluating the long-term effects of this work. Similarly, possible contaminant remediation and restoration at the Smurfit-Stone Mill site near Frenchtown could have major benefits for river water quality, floodplain function, and habitat quality in that reach.

Social Conflicts

Proximity to Missoula, a large overall population base, and many conflicting demands make managing public recreation challenging on the Clark Fork River. In 2011, the reach through Missoula and downstream to the Alberton Gorge were part of a revised river recreation plan, balancing motorized and non-motorized boat use in the area. This and other issues, including management of river access and non-angling recreationists, will certainly be a focus in the future.

In 2011, FWP completed a public process to revise boating regulations for this section of the Clark Fork River. The regulation changes were in response to an increase in river use in and around Missoula, and intended to provide for diverse river recreation opportunities and to address public safety and social concerns associated with fast-moving motorboats operating in proximity to other users. These regulations took effect November 26, 2011.

FISHERIES MANAGEMENT DIRECTION FOR MIDDLE CLARK FORK RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Clark Fork River - Blackfoot River confluence downstream to confluence with Flathead River	120 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/Special Regulations	Continue yearlong closure on angling for bull trout. Enhance fluvial populations for conservation and catch-and-release westslope cutthroat trout fishery.
		Rainbow trout, Brown trout	Wild	Quality/Special Regulations	Protect adults and fishery quality through fishing regulations. Protect habitat, ensure adequate connectivity with tributaries & enhance natural recruitment in areas that are not native trout strongholds.
		Northern pike, Smallmouth bass	Wild	General/Special Regulations/Suppression	No creel limit for pike; encourage harvest of both introduced warmwater species to reduce competition with and predation on trout.
Habitat needs and activities: Assess long-term impact of Milltown Dam removal. Assess contamination of Smurfit-Stone Mill site and facilitate remediation/restoration. Further enhance connectivity with tributaries where appropriate. Protect and improve habitat quality in spawning and rearing areas to enhance natural recruitment of wild and native trout.					
Kreiss Lake	10 acres	Westslope cutthroat trout	Hatchery	Put-Grow-Take	Facilitate high catch rates and quality harvest opportunity.
		Largemouth bass	Wild	General	Provide liberal harvest opportunity.
Habitat needs and activities: Evaluate westslope cutthroat trout stocking prescription. Ensure that adequate water volume is maintained in lake.					
Silers Lagoon (McCormick Pond)	5 acres	Westslope cutthroat trout, Rainbow trout	Hatchery	Family Fishing/ Put- Grow-Take/ Special Regulations	Kids fishing pond - Facilitate high catch rates and quality harvest opportunity for kids.
		Northern pike, Pumpkinseed, Yellow perch	Wild	General	Provide liberal harvest opportunity. Reduce numbers if possible.
Habitat needs and activities: Reduce entrainment of unwanted fish from water supply canal. Ensure adequate water exchange rate.					
Frenchtown Pond Continued on next page	22 acres	Rainbow trout	Hatchery	Put- Take	Facilitate high catch rates and quality harvest opportunity for kids fishing events and families.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Largemouth bass	Transfer	Social/Quality/Special Regulations	Restrictive harvest regulations to ensure quality of fishery. Continue to plant adult fish if available.
		Northern pike, Pumpkinseed, Yellow perch	Wild	General	Provide liberal harvest opportunity. Reduce numbers if possible.
Habitat needs and activities: Continue adult bass transfer from Lee Metcalf Refuge. Ensure enforcement presence to promote compliance and maintenance of quality largemouth bass fishery.					
Fish Creek, Little Joe Creek, and Cedar Creek Drainages	264.7 miles 37.6 miles 42.7 miles	Bull trout, Westslope cutthroat trout	Wild	Conservation/Special Regulations	Conserve and enhance migratory and resident populations. Continue yearlong closure on angling for bull trout.
		Rainbow trout, Brown trout, Brook trout	Wild	General/Special Regulations	Maintain present numbers and sizes. Consider management that reduces numbers and distribution if it would improve native trout numbers and WCT angling opportunities.
Habitat needs and activities: Improve habitat to support ecosystem function and production of native trout and whitefish. Enforcement presence needed to ensure compliance. Eliminate brook trout from headwater lakes.					
Open Tributary Systems (Fish Barriers Generally Absent):		Bull trout, Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Conserve and enhance migratory and resident populations. Continue protective regulations to enhance westslope cutthroat trout fishery. Continue yearlong closure on angling for bull trout.
St. Regis River,	38.6 miles	Rainbow trout, Brown trout	Wild	Quality/ Special Regulations	Protect adult spawners and fishery quality through fishing regulations. Protect habitat and ensure adequate connectivity with tributaries to enhance natural recruitment in areas that are not native trout strongholds.
Ninemile Creek,	25.5 miles				
Rattlesnake Cr.	23.3 miles				
Grant Creek,	18.3 miles				
Dry Creek,	15.3 miles	Brook trout	Wild	General/Suppression	Provide liberal harvest opportunity and reduce numbers if possible.
Trout Creek,	14.7 miles				
Mill Creek,	13.4 Miles				
Albert Creek,	11.4 Miles				
Nemote Creek,	9.8 Miles				
Sixmile Creek,	8.9 Miles				

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Siegel Creek, Petty Creek	7.0 Miles 4.3 Miles				
Habitat needs and activities: Improve habitat quality and connectivity where needed.					
Closed Tributary Systems (Barriers Prevent Upstream Movement from Clark Fork River) - Contain Genetically Pure, Isolated Westslope cutthroat trout Populations:		Westslope cutthroat trout Brook trout	Wild	Conservation General/ Suppression	Ensure isolation and restrict introduction of hybridizing species. Restrict harvest to maintain or enhance numbers. Provide liberal harvest opportunity and reduce numbers where possible.
Patrick Cr.,	4.5 Miles

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
O'Keefe Cr., Lavalley Cr., Butler Cr., Marshall Cr.	1.7 Miles 1.6 Miles 2.7 Miles 4.8 Miles				
Habitat needs and activities: Maintain fish passage barriers isolating populations from Clark Fork River, improve habitat and connectivity within drainages, and restrict new fish introductions – particularly in fish ponds.					
High Elevation (Mountain) Lakes: 121 Lakes Total > 1 Acre in Bitterroot Mountains and Rattlesnake Wilderness <i>See specific Mountain Lake Management Plan Reports for Each Water Body</i>	1-30 Acres each, 861 Acres Total	Westslope cutthroat trout Westslope cutthroat trout Brook trout Yellowstone cutthroat trout Rainbow trout <i>Fishless Lakes</i>	Wild Wild/ Hatchery Wild Wild Wild N/A	Conservation Put-Grow-Take General General General Conservation	13 lakes – Self-sustaining fisheries of various quality. 14 lakes – Management objective varies by lake, including trophy, quality, and harvest-oriented fisheries. 18 lakes – Reduce densities or eliminate to improve quality. 3 lakes – Self-sustaining fisheries of various quality 8 lakes - Self-sustaining fisheries of various quality 65 lakes – Maintain ecological integrity.
Habitat needs and activities: Evaluate stocking prescriptions for Put-Grow-Take fisheries. Maintain fishless lakes. Remove or suppress brook trout to enhance quality of fisheries and complement downstream native fishery goals.					

LOWER CLARK FORK RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Lower Clark Fork River begins at its confluence with the Flathead River and terminates at the inlet to Lake Pend Oreille in Bonner County, Idaho. In Montana, this drainage falls almost entirely within Sanders County. The river flows for 94 miles through a drainage of 1.4 million acres before exiting the state. Elevations range between 2,191 and 8,735 feet. Approximately 83% of the land within the drainage is managed by the Lolo and Kootenai National Forests. Privately owned land is primarily confined to the valley floor and the Thompson River drainage. Primary land uses include agriculture, wilderness, forest products, recreation and hydropower generation.

There are 49 lakes or reservoirs in the drainage, totaling 14,483 surface acres. Numerous, natural headwater lakes are found at higher elevations. The largest of these lakes, Wanless Lake, lies within the Cabinet Mountain Wilderness area. The Thompson, Bull and Vermillion rivers are the largest tributaries contributing to the lower Clark Fork. The lower Clark Fork River is comprised of riverine and reservoir habitats. Approximately 62 miles of the river has been inundated by the Thompson Falls, Noxon Rapids and Cabinet Gorge Reservoirs. These reservoirs were impounded to generate hydroelectricity. Noxon Reservoir is the largest reservoir impounding an area of 7,592 acres at full pool followed by Cabinet Gorge (2,848 acres) and Thompson Falls (969 acres).

FISHERIES MANAGEMENT

Diverse habitat types throughout the Lower Clark Fork River drainage provide numerous fishing opportunities, including warm, cool and cold water sport fisheries and important habitat for native species. Largemouth and smallmouth bass, northern pike, yellow perch and several trout species are the primary species targeted by fishermen. Native species management is primarily focused on trout and whitefish.

Native species within the drainage include bull trout, westslope cutthroat trout, mountain whitefish, longnose and largescale sucker, northern pikeminnow, peamouth, longnose dace, reidside shiner, and Columbia slimy and Rocky Mountain Rocky Mountain sculpins. Native species management is focused on salmonids with an emphasis on bull trout recovery. The lower Clark Fork River and several of its tributaries are designated as bull trout critical habitat. Bull trout in this drainage exhibit both resident and migratory life histories with some fish moving to mainstem rivers, reservoirs or Lake Pend Oreille to mature. Primary impacts to this species include passage barriers, habitat degradation and introduced species. Currently these impacts are being addressed through the Avista Utilities and PPL Montana hydromitigation programs, which are required by FERC and stipulated in their operating licenses. Fish passage at the Thompson Falls Dam, owned and operated by PPL, is facilitated by a fish ladder that began operation in spring 2011. Upstream passage at the Cabinet Gorge Dam, owned and operated by Avista Utilities, is facilitated by a capture and transport program that returns adult fish to their natal tributaries based on genetic assignments. Additionally, the juvenile trap and transport program traps out-migrating juvenile bull trout from tributaries and transports them to Lake Pend Oreille.

Both utilities have programs to protect and restore tributary habitats. In Lake Pend Oreille, lake and rainbow trout are being suppressed by Idaho Fish and Game to benefit kokanee and migratory bull trout, many of which originate in the Clark Fork drainage. An experimental nonnative fish suppression and exclusion project is being conducted in the East Fork Bull River to assess the effectiveness of weir exclusions and fish removal on brown and brook trout.

The lower Clark Fork drainage contains numerous high elevation ponds and lakes in tributary headwaters. Many of these waters contain fish that are supported by natural reproduction or stocking. Westslope cutthroat trout are the primary species found in most of these habitats, however, some waters contain brook trout and rainbow trout. Access to many of these lakes is limited to non motorized travel; some are accessible by vehicle. Angling pressure is highest during the summer and fall when these waters are accessible.

Tributaries to the Clark Fork River provide angling opportunity for trout. The Thompson and Bull Rivers receive significant angling pressure with other tributaries receiving considerably less. With the exception of the Thompson River, tributaries are closed to angling between November 30 and the third Saturday in May to protect spawning westslope cutthroat trout.

The Thompson River below its confluence with the Little Thompson River remains open year-round, providing fishing opportunity for whitefish and trout anglers. Trout fishing is limited to catch and release for all species between December 1 and the third Saturday in May and cutthroat and rainbow trout must be released year-round.

Riverine portions of the Clark Fork River provide some fishing for smallmouth bass and northern pike, and limited trout fisheries. Native suckers and minnows dominate this habitat. Cold water species such as trout and whitefish are limited due to warm summer water temperatures.

Reservoirs on the lower Clark Fork River are popular warm and cool water fisheries. Yellow perch and northern pike are pursued by anglers year round and largemouth and smallmouth bass fishing picks up as water temperatures warm in the spring. Noxon Reservoir hosts up to seven bass fishing tournaments annually and currently holds the state record for northern pikeminnow and largemouth bass. Spring walleye fishing between Thompson Falls Dam and Noxon Reservoir is increasing in popularity as the illegally introduced population expands.

Walleye were illegally introduced into Noxon Reservoir in the mid to late 1980s. Since then, walleye catch rates slowly increased until 2009 when catch rates began to rapidly increase, doubling in 2010 and 2011. Expanding walleye populations pose a significant predation threat to native and sport fisheries in Noxon Rapids and Cabinet Gorge Reservoirs and future management actions will focus on this species.

One sub-impoundment on Noxon Rapids Reservoir and two on Cabinet Gorge Reservoir provide angling on smaller bodies of water not directly connected to the reservoirs. The Frog Pond on Noxon Rapids Reservoir and Triangle Pond on Cabinet Gorge Reservoir are community fisheries that are stocked with rainbow trout. Triangle Pond is also a popular burbot fishery when ice conditions are safe. Queens Cut on Cabinet Gorge Reservoir is a popular fishery for perch and bass that is not actively managed.

HABITAT

Tributary habitat in the Lower Clark Fork Drainage has been shaped by numerous natural and man-caused conditions. Somewhat unique to the area are sections of streams that seasonally go dry each year, caused by coarse gravel and rubble deposited in basins during the time of Glacial Lake Missoula. Intermittent stretches have partially isolated some upstream fish populations and selected for mixed or resident life histories in some streams. These conditions are not fully understood and are currently being researched.

The Thompson River has a unique habitat trait in that water temperatures cool as water flows downstream. The headwaters of the Thompson River begin at the outlet of the Thompson Chain of Lakes. Summer temperatures in these lakes are generally warm and elevate stream temperatures at their outlets. In the lower drainage, cold, pristine tributary inflows lower water temperatures. Fish Trap Creek and the West Fork Thompson River are the primary contributors of cold water.

Tributary habitat has also been shaped by land use throughout the lower Clark Fork. Timber production and grazing have been the primary land uses and have led to numerous problems including fragmentation associated with culverts and roads, sedimentation, bank destabilization, thermal impacts associated with degraded riparian areas, and channel alterations constructed to prevent flooding, or to move or confine streams. Road construction for timber hauling and residential development has impacted many riparian areas and stream channels. Mining has played a lesser role in shaping habitat; however, small scale mine claims exist throughout the drainage and many are active within floodplains. Proposed copper and silver mines near the Cabinet Mountain Wilderness areas could significantly alter habitat in the Rock Creek and Bull River drainages. Current estimates suggest mining could reduce base flows in these streams by seven percent.

The Lower Clark Fork drainage has eight watershed councils that actively manage drainage-wide water resource issues. Additionally, the Lower Clark Fork Watershed Group (LCFWG) is also active in the drainage. The LCFWG acts as an umbrella organization for the watershed councils and facilitates cooperation between them. The group is also active in identifying and conducting habitat restoration projects and educating landowners on proper stream and riparian habitat management. The focus area of this group ranges from the Idaho border upstream to Prospect Creek. Within this area the LCFWG has prepared or assisted with preparing watershed assessments in all the larger tributaries.

Approximately 66% of the Lower Clark Fork River has been converted from riverine to reservoir habitat by three hydroelectric facilities. All three reservoirs are run-of-the-river and experience limited drawdowns in most years. Reservoir drawdowns are limited to 10 feet in Noxon Rapids and Cabinet Gorge Reservoirs. Currently, fish passage is facilitated at Thompson Falls and Cabinet Gorge dams. Thompson Falls Dam was outfitted with a fish passage ladder that has been in operation since spring 2011. Bull trout passage at the Cabinet Gorge Dam is facilitated by active capture techniques and upstream transport to the fish's tributary of origin based on genetic assignment. Permanent upstream fish traps are currently being designed for Cabinet Gorge and Noxon Rapids reservoirs. Construction of the Cabinet Gorge fish trap will likely begin in 2013.

Designs for the Noxon Rapids fish trap have not been completed and a construction date has not been set.

Water quality in the lower Clark Fork River is impacted by mercury. Fish consumption advisories exist for many popular sport fish with large walleye and northern pike being the most restrictive. The source of the excess mercury is from both natural geology and upstream industrial activities

FISHING ACCESS

Fish, Wildlife and Parks maintains six Fishing Access Sites throughout the drainage. Three of these are found at the headwaters of the Thompson River on McGregor Lake and the Thompson Chain of Lakes. Two provide access to the Clark Fork River and the remaining site provides boat access to Noxon Reservoir near Flat Iron Ridge. In addition to FWP sites, the US Forest Service and Avista Utilities provide developed access at numerous sites throughout the drainage. An extensive road and trail network on public land throughout the drainage provides access to undeveloped sites.

There is 28 miles of the Clark Fork River between access points at Plains and Thompson Falls. There is a need to locate an access about halfway in between (near Weeksville) to accommodate half-day floats and complete river corridor access between Missoula and Thompson Falls.

There is a need to identify opportunities to improve fishing access in the Bull River drainage.

FISHERIES MANAGEMENT DIRECTION FOR LOWER CLARK FORK RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Lower Clark Fork River - Confluence with Flathead River to Idaho Border	32 miles	Bull trout	Wild	Conservation	Continue to monitor population trends. Reestablish volitional fish connectivity. Continue yearlong closure on angling for bull trout.
		All other species	Wild	General	Continue to monitor distribution and status throughout the drainage.
Habitat needs and activities: Monitor drainage for potential habitat threats and restoration opportunities.					
Thompson Falls Reservoir	969 acres	Bull trout	Wild	Conservation	Assess habitat use, survivorship and limiting factors of reservoir reared or fluvial fish. Continue to operate fishway for PPL Montana. Continue yearlong closure on angling for bull trout.
		All other species	Wild	General	Continue to monitor population trends.
McGregor Lake	1,522 acres	Lake trout	Wild	General	Manage harvest to support angling opportunity while reducing numbers to improve size and benefit other put and take fisheries.
		Rainbow trout	Hatchery	Put-Grow-Take	Provide harvest and recreational opportunity for occasional 1-3 pound rainbows. Continue to boat plant trout throughout the lake to minimize predation by lake trout.
		Kokanee salmon	Hatchery	Put-Grow-Take	Provide quality harvest and recreational opportunity for occasional salmon up to 15". Identify if continued stocking is warranted based on predatory lake trout population.
Little McGregor Lake	33 acres	Rainbow trout	Hatchery	Put-Grow-Take	Provide quality harvest and recreational opportunity for 1+ pound rainbows. Identify if stocking is warranted based on competition with stunted yellow perch population.
		Yellow perch	Wild	General	Provide for harvest of at least 8" yellow perch. Monitor population structure to determine if quality perch population can be sustained or if lake should be rehabilitated for salmonids.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Upper Thompson Lake	294 acres	Northern pike	Wild	General	Continue to provide for liberal harvest including spearing to provide for recreational opportunity and decrease predation on Put and take fisheries and yellow perch.
		Yellow perch	Wild	General	Maintain recreational angling and harvest opportunity
		Largemouth bass	Wild	General	Maintain recreational angling and harvest opportunity. Through regulation, enhance opportunity for spawning size bass (>14”).
Middle Thompson Lake	557 acres	Northern pike	Wild	General	Continue to provide for liberal harvest including spearing to provide for recreational opportunity and decrease predation on put and take fisheries and yellow perch.
		Rainbow trout	Hatchery	Put-Grow-Take	Identify if continued stocking is warranted based on predator populations of northern pike and bass.
		Kokanee salmon	Hatchery/ Wild	Put-Grow-Take/ Special Regulations	Maintain regulations that promote protection of naturally reproducing population with opportunity for larger kokanee Continue to monitor contribution to population of hatchery versus wild kokanee. Identify if stocking is warranted based on predator populations of northern pike and bass.
		Yellow perch	Wild	General	Maintain recreational angling and harvest opportunity
		Largemouth bass	Wild	General	Maintain recreational angling and harvest opportunity. Through regulation, enhance opportunity for spawning size bass (>14”).
Habitat needs and activities: Monitor perched culvert between Middle Thompson Lake and Upper Thompson Lake for obstruction to fish movement. Identify if replacement is necessary.					
Lower Thompson Lake	240 acres	Northern pike	Wild	Wild	Continue to provide for liberal harvest including spearing to provide for recreational opportunity and decrease predation on put and take fisheries and yellow perch.
		Rainbow trout	Hatchery	Put-Grow-Take	Identify if continued stocking is warranted based on predator populations of northern pike and largemouth bass.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Kokanee salmon	Hatchery/ Wild	Put-Grow-Take/ Special Regulations	Maintain regulations that promote protection of naturally reproducing population with opportunity for larger kokanee. Monitor contribution to population of hatchery versus wild kokanee. Identify if continued stocking is warranted based on predator populations of northern pike and bass.
		Yellow Perch	Wild	General	Maintain recreational angling and harvest opportunity
		Largemouth bass	Wild/ Hatchery	General/Put-Grow-Take	Maintain recreational angling and harvest opportunity. Through regulation, enhance opportunity for spawning size bass (>14"). Monitor contribution to population of hatchery versus wild bass. Identify if continued stocking is warranted
Thompson River	55 miles	Bull trout, Westslope cutthroat trout	Wild/ Transfer	Conservation/ Special Regulations	Continue to monitor population trends. Continue yearlong closure on angling for bull trout. Continue upstream bull trout transport program for fish from below Cabinet Gorge Dam. Assess and monitor habitat conditions. Continue yearlong closure on angling for bull trout.
		Rainbow trout, Brown trout	Wild	Special Regulations	Continue to manage harvest to provide angling opportunity for larger trout with restrictive regulations and minimize impacts on native fish
		Mountain whitefish, Sculpin, Longnose dace, Brook trout	Wild	General	Provide winter fishery for mountain whitefish in lower 17 miles of river.
Habitat needs and activities: Decrease sedimentation and stream bank instability through instream and riparian habitat restoration. Investigate causes of elevated water temperatures and restore if possible.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Little Thompson River	20.3 miles	Westslope cutthroat trout	Wild	General	Continue to monitor distribution and status throughout the drainage. Continue to limit harvest.
		Brook trout	Wild	General	Maintain liberal regulations. Determine if there are impacts on native fish.
Habitat needs and activities: Identify leading causes of habitat degradation and determine if restoration would benefit bull trout.					
Fish Trap Creek	27.5 miles	Bull Trout	Wild/ Transport	Conservation	Continue to monitor population trends. Continue downstream and upstream bull trout transport program. Continue yearlong closure on angling for bull trout.
		Westslope cutthroat trout	Wild	Special Regulations/ Conservation	Continue to monitor distribution and status throughout the drainage. Continue to limit harvest.
Habitat needs and activities: Assess habitat and hydrologic conditions. Restore habitat where necessary.					
West Fork Thompson River	8.4 miles	Bull trout	Wild/ Transport	Conservation	Continue to monitor population trends. Continue downstream and upstream bull trout transport program. Continue yearlong closure on angling for bull trout.
		Westslope cutthroat trout	Wild	Conservation	Continue to monitor distribution and status throughout the drainage. Continue to limit harvest.
Habitat needs and activities: Assess habitat and hydrologic conditions. Restore habitat where necessary.					
Prospect Creek	77.6 miles	Bull trout	Wild/ Transport	Conservation	Continue to monitor population trends. Continue downstream and upstream bull trout transport program. Continue yearlong closure on angling for bull trout.
		Westslope cutthroat trout	Wild	Conservation	Continue to monitor distribution and status throughout the drainage.
		Mountain whitefish, Sculpin, Rainbow trout,	Wild	General	Continue to monitor distribution and status throughout the drainage. Continue to monitor effectiveness of the Blossom Lakes brook trout removal in the upper drainage.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Brook trout, Brown trout			
Habitat needs and activities: Develop a working group to identify potential habitat restoration and mitigation projects. Restore habitat degraded by land use, roads, pipelines and power lines. Continue to monitor previously conducted habitat restorations.					
Graves Creek	19.2 Miles	Bull trout	Wild/ Transport	Conservation	Continue to monitor population trends. Continue downstream and upstream bull trout transport program. Continue yearlong closure on angling for bull trout.
		Westslope cutthroat trout, Mountain whitefish	Wild	Conservation/ General	Continue to monitor distribution and status throughout the drainage. Identify factors limiting native salmonids.
		Sculpin, Rainbow trout, Brown trout, Brook trout	Wild	General	Continue to monitor distribution and status throughout the drainage.
Habitat needs and activities: Monitor drainage for potential habitat threats and restoration opportunities.					
Vermillion River	43.2 Miles	Bull trout	Wild/ Transport	Conservation	Continue to monitor population trends. Continue downstream and upstream bull trout transport program. Continue yearlong closure on angling for bull trout.
		Westslope cutthroat trout	Wild	Conservation	Continue to monitor distribution and status throughout the drainage.
		Mountain whitefish, Sculpin, Rainbow trout, Brown trout, Brook trout	Wild	General	Continue to monitor distribution and status throughout the drainage.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

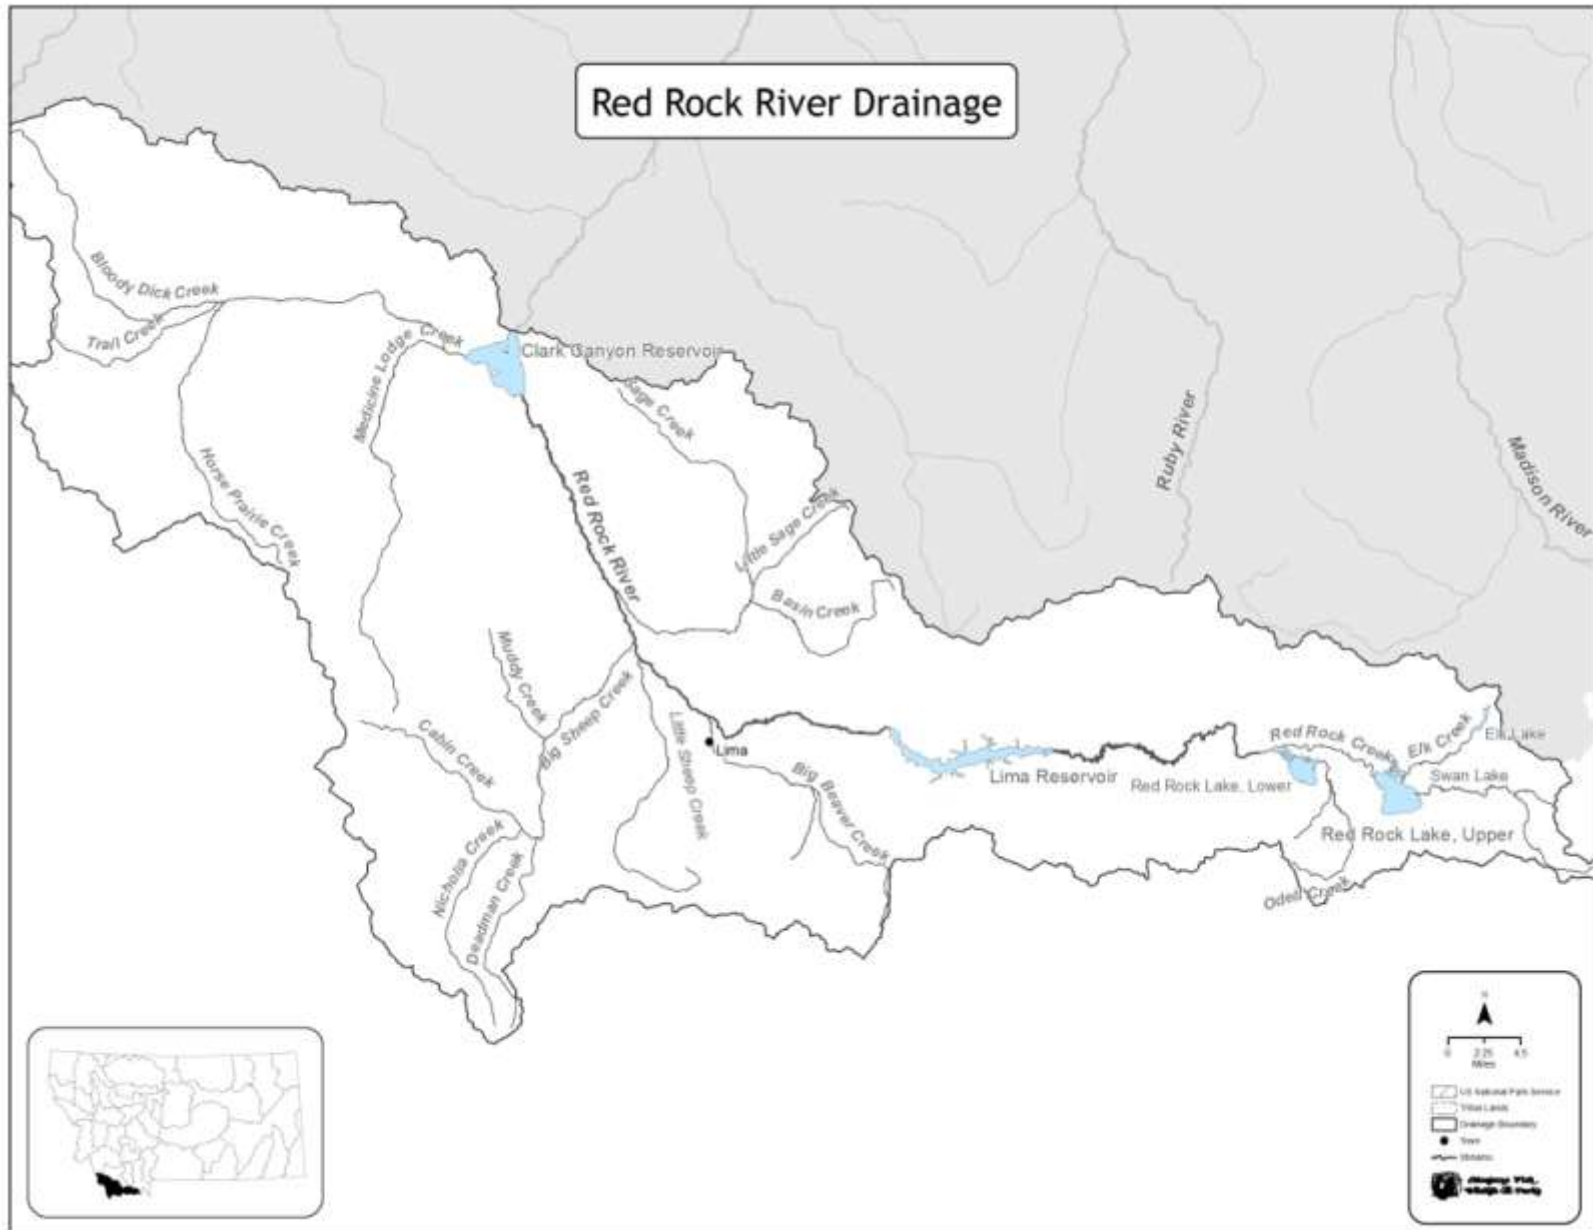

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Habitat needs and activities: Continue to reduce sediment sources by stabilizing stream banks and repairing riparian habitat.					
Noxon Rapids Reservoir	7,592 Acres	Bull trout	Wild	Native	Assess habitat use, survivorship and limiting factors of reservoir reared fish. Reestablish volitional fish passage past Noxon Rapids Dam. Administer Montana portion of Avista fisheries mitigation program. Continue yearlong closure on angling for bull trout.
		Walleye	Wild	Suppression	Suppress illegally introduced walleye from the reservoir as possible.
		Largemouth bass, Smallmouth bass	Wild	General/ Special Regulations	Maintain later spawning closure to protect spawning bass. Monitor impacts of fishing derbies and general harvest on bass > 12".
		All other species	Wild	General	Continue to monitor population trends.
Trout Creek	30.2 Miles	Bull trout	Wild	Conservation	Continue to monitor population trends. Continue yearlong closure on angling for bull trout.
		Westslope cutthroat trout	Wild	Conservation	Continue to monitor distribution and status throughout the drainage.
		Longnose dace, Rainbow trout, Brown trout, Brook trout	Wild	General	Continue to monitor distribution and status throughout the drainage.
Habitat needs and activities: Monitor drainage for potential habitat threats and restoration opportunities.					
Swamp Creek	16.6 Miles	Bull trout	Wild/ Transfer	Conservation	Continue to monitor population trends. Continue upstream bull trout transport program. Continue yearlong closure on angling for bull trout.
Continued on next page		Westslope cutthroat trout	Wild	Conservation	Continue to monitor distribution and status throughout the drainage.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Mountain whitefish, Largescale sucker, Sculpin, Rainbow trout, Brown trout, Brook trout	Wild	General	Continue to monitor distribution and status throughout the drainage.
Habitat needs and activities: Monitor drainage for potential habitat threats. Restore degraded habitat identified in the USFS watershed assessment.					
Rock Creek	17 Miles	Bull trout	Wild/ Transfer	Conservation	Continue to monitor population trends. Continue downstream and upstream bull trout transport program. Continue yearlong closure on angling for bull trout.
		Westslope cutthroat trout	Wild	Conservation	Continue to monitor distribution and status throughout the drainage. Work with partners to minimize effects of reduced base flows and habitat impacts associated with proposed mines in the headwaters.
		Rainbow trout, Brown trout, Brook trout	Wild	General	Continue to monitor distribution and status throughout the drainage. Work with partners to minimize effects of reduced base flows and habitat impacts associated with proposed mines in the headwaters.
Habitat needs and activities: Monitor drainage for potential habitat threats and restoration opportunities with potential mine development.					
Cabinet Gorge Reservoir	2,848 Acres	Bull trout	Wild	Conservation	Assess habitat use, survivorship and limiting factors of reservoir reared fish. Reestablish volitional passage past Cabinet Gorge Dam. Administer Montana portion of Avista fisheries mitigation program. Continue yearlong closure on angling for bull trout.
		Westslope cutthroat trout	Wild	Conservation	Work with Idaho Fish and Game Department to assess potential for passage of fish above dam.
		All other species	Wild	General	Continue to monitor population trends.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Bull River	71.6 miles	Bull trout	Wild/ Transfer	Conservation	Continue to monitor population trends. Continue downstream and upstream bull trout transport program. Continue yearlong closure on angling for bull trout.
		All other species	Wild	General	Continue to monitor distribution and status throughout the drainage. Continue to exclude introduced salmonids (rainbow, brown, brook trout) from the East Fork Bull River.
Habitat needs and activities: Continue to restore degraded habitat identified in the Bull River Watershed Assessment. Monitor potential mine impacts.					
Mountain Lakes	1,112 acres total	Westslope cutthroat trout	Wild/ Hatchery	Put-Grow-Take/General	Survey mountain lakes to determine distribution and status of wild populations, Continue stocking to provide a recreational fishery with a variety of fish sizes and catch rates.
		Brook Trout	Wild	General	Survey mountain lakes to determine distribution and status of wild populations, Identify populations that can be managed or where removal may be necessary if impacts to native fish.
Clark Fork Tributary Streams (McLaughlin, Henry, Combest, Boyer, Lynch, Weeksville, Swamp (east), Eddy, Munson, Quartz, Malone, Outlaw, Cherry, Squaylth-Kwum, Mosquito, Deep, Beaver, Tuscor, Martin, Stevens, McKay, Pilgrim, Blue, Elk)	1,214 miles	All	Wild	General	Survey previously un-sampled creeks to determine the distribution and status of the fish. Monitor previously surveyed populations.
Habitat needs and activities: Protect sections of high quality habitat where necessary and restore habitat when beneficial to native species.					

RED ROCK RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Red Rock River originates in the Centennial Valley and flows west through Upper and Lower Red Rock Lakes and then to Lima Reservoir. Lima Reservoir is a 6,800 acre irrigation storage facility built in 1902. From Lima Dam, the river flows an addition 57.4 miles in a northwesterly direction through agricultural and grazing lands before discharging into Clark Canyon Reservoir. Clark Canyon Reservoir is a 4,900 acre irrigation impoundment that was built in 1964. Prior to construction of Clark Canyon Reservoir, the Red Rock River and Horse Prairie Creek converged to form the Beaverhead River. Major tributaries of the Red Rock River include Big Sheep Creek and Horse Prairie Creek. The Red Rock River drains an area of 1,580 square miles, about half of which lies on the mountain slopes of the Continental Divide.

The Centennial Valley occurs primarily at over 6,000 ft of elevation and remains one of the least inhabited large high valleys in the state of Montana. The Centennial Mountains rise abruptly about 3,000 ft above the valley floor to form the Continental Divide and the valley's southern boundary. The northern boundary is formed by the gently rounded sagebrush covered hills of the Gravelly Range. The Valley is about 50 miles long and 7 miles wide and is drained by the Red Rock River which flows into Lima Reservoir to the west. Elevation at the headwaters of Red Rock Creek is approximately 8,100 feet and constitutes the upstream most headwaters of the Missouri River. The Red Rock leaves the valley at about 6,450 feet in elevation.

There are 23 lakes or reservoirs within the drainage, totaling 14,939 surface acres. Clark Canyon is the largest reservoir in the drainage at 4815 acres. Two large shallow lakes, Upper (893 ha) and Lower (456 ha) Red Rock lakes, dominate the valley floor in the Centennial Valley. Both lakes have uniform, shallow (< 6 ft) basins with aquatic vegetation throughout bottoms of mud, peat, and detritus. Elk Lake, which is 207 acres and about 60 feet deep, occurs in the northeast corner of the valley at 6,750 feet in elevation. Several other small lakes and reservoirs occur throughout the mountain ranges bounding the valley. Four major streams, Red Rock, Elk, Tom, and O'dell creek occur upstream of the Red Rock Lakes. The Red Rock River begins as the outlet of Lower Red Rock Lake. In addition, many small mountain and spring fed streams occur throughout the Centennial Valley.

The Centennial Valley hosts the longest winters in the nation, excluding Alaska. Snowfall averages over 138 inches annually and frost can occur in every month of the year. Annual precipitation averages around 19 inches. The timbered slopes and rocky basins of the area capture the heavy winter snows and provide a constant supply of water for the 14,000 acres of lakes, marshes, and streams within the valley.

FISHERIES MANAGEMENT

Fish communities in the Red Rock River basin downstream from Lima Reservoir are common to Southwestern Montana. These species include: rainbow trout, brown trout, brook trout, hybrid westslope cutthroat trout, westslope cutthroat trout (primarily in isolated tributaries), mountain

whitefish, common carp, longnose dace, longnose sucker, Rocky Mountain sculpin, and white sucker.

Native fish species that occur in the Centennial Valley include Arctic grayling, lake trout, westslope cutthroat trout, burbot, mountain whitefish, white sucker, longnose sucker, longnose dace, and sculpin. Nonnative species include brook trout, Yellowstone cutthroat trout, rainbow trout, and Utah chub.

Fisheries in the Centennial Valley are managed primarily for conservation and recreational angling of native species. Where nonnative species occur, they are managed as recreational fisheries. The Red Rocks National Wildlife Refuge, which was established in 1935 for trumpeter swan conservation, occupies over 39,000 acres in the eastern part of the valley. Stream and lakes that occur there are co-managed with the Refuge to ensure that their fisheries and wildlife goals and mandates are met. The remainder of the valley is private, BLM, and DNRC lands, much of which is managed primarily for cattle grazing.

Fish stocking in the Red Rock River basin occurred between the 1930s and 1970s when wild trout management philosophies were instituted. Typical species stocked included cutthroat trout, rainbow trout, and brown trout. Upstream from Lima Reservoir, documentation of historical stocking is limited, showing only one stocking of rainbow trout in 1959. Yellowstone cutthroat trout were also stocked into the Red Rock River drainage upstream from Lima reservoir; however, official records are limited to stocking that occurred once in 1936 of undesignated cutthroat trout. Like many waters in Montana, complete stocking records do not exist, and stocking likely occurred frequently prior to the 1930s.

In recent years, Arctic grayling have been stocked in the Upper Red Rock River basin in support of conservation actions (including Elk Lake). Since the 1930s, Elk Lake has been stocked with rainbow trout, Yellowstone Cutthroat Trout, and most recently westslope cutthroat trout. Due to limited natural reproduction potential in Elk Lake, rainbow trout and Yellowstone cutthroat trout are likely not present at the current time.

Fishing regulations throughout the Red Rock River basin follow Central District Standard regulations with a few exceptions. In Big Sheep and Red Rock creeks, and several other smaller tributaries, cutthroat trout are included in the Combined Trout limit. Cutthroat trout are managed with catch-and-release only regulations in the remainder of the drainage. In the Red Rock River downstream from Lima Reservoir, harvest rates are reduced for Combined Trout (3 daily and in possession, only 1 over 18 inches). Arctic grayling are protected by catch-and-release regulations throughout the basin, and lake trout are protected by catch-and-release regulations in Elk Lake.

The combined trout harvest limit in Clark Canyon Reservoir is three daily and in possession. Burbot harvest regulations are also exceptions to the Central District Standard regulation allowing only three burbot daily and in possession and only 1 over 28 inches. Both of these regulations are directed at maintaining high size structure to the trout and burbot populations within the reservoir.

Angling is currently not allowed in either Upper or Lower Red Rock Lakes. Otherwise, with the exception of Clark Canyon Reservoir, angler use of waters within the Red Rock River basin is low. Elk Lake has the highest angler use relative to the size of the water (207 acres), with effort

approaching 2,000 angler days in 2009. Over the past decade, angling pressure on Clark Canyon Reservoir has varied from 14,452 angler days in 2003 to 37,709 angler days in 2009. Total use by non-resident anglers has varied from 7 to 42 percent of all angler days over the last decade.

HABITAT

The Red Rock River upstream from Lima Reservoir is a low gradient stream, flowing for 29.3 miles through open sagebrush country within the Centennial Valley. In the Centennial Valley, the river has a sand-gravel bottom that is covered in vast areas with accumulations of silt. The narrow riparian zone is vegetated with sedges, grasses and clumps of willow. Over half of this reach passes through parcels of public land controlled by the BLM, State of Montana, and FWS. The summer grazing of livestock is the major land use along this stretch of the Red Rock River.

Between Lima Dam and Clark Canyon Reservoir, the Red Rock River flows for 57.4 miles through privately owned valley lands, primarily used for hay production and the wintering of cattle. The river width averages about 45 feet at low flow, and the substrate is comprised of gravel-cobble with some silt deposition in the slower moving waters. The narrow riparian zone is primarily vegetated with grasses, willows, alders and cottonwoods. Approximately 35,000 acres of land is irrigated within this reach of river. Stream dewatering can be severe in this reach of the Red Rock River, with flow ceasing for several days at a time within short stretches of river. Wintering cattle have damaged the stream banks along portions of the reach, creating raw and eroding banks.

A USGS gage was operated from 1936 through 1967 at river mile 10.4. The mean annual flow for the six complete years of record (1937-1942) was 93.6 cfs. For the remaining period of operation, only non-winter flows were recorded. Non-winter monthly mean flows varied from 47.1 cfs in September to 408 cfs in May. Water to irrigate about 6,000 acres is diverted upstream from this historic gage.

FISHING ACCESS

No FWP Fishing Access Sites exist within the Red Rock River Basin, but public lands generally provide adequate access to waters within the basin.

SPECIAL MANAGEMENT ISSUES

In 2007, Montana Fish, Wildlife & Parks, and partners (BLM, USFWS, USFS, Montana Council Trout Unlimited, Montana Chapter American Fisheries Society, Yellowstone National Park, Montana Arctic Grayling Recovery Program, NRCS, and DNRC) all cosigned a Memorandum of Understanding (MOU) concerning Montana Arctic Grayling Conservation. This MOU defines responsibilities and procedures agreed to by all signatory agencies conserving conservation actions to benefit Arctic grayling in Montana.

The Red Rock River drainage is also home to several conservation populations of westslope cutthroat trout providing opportunities to conserve this native species in the drainage. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of non-native species and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of

competition and hybridization from non-native species. The long-term goal of cutthroat conservation in the Red Rock is to have 20% of the historically occupied habitat restored to cutthroat trout.

FISHERIES MANAGEMENT DIRECTION FOR RED ROCK RIVER DRAINAGE

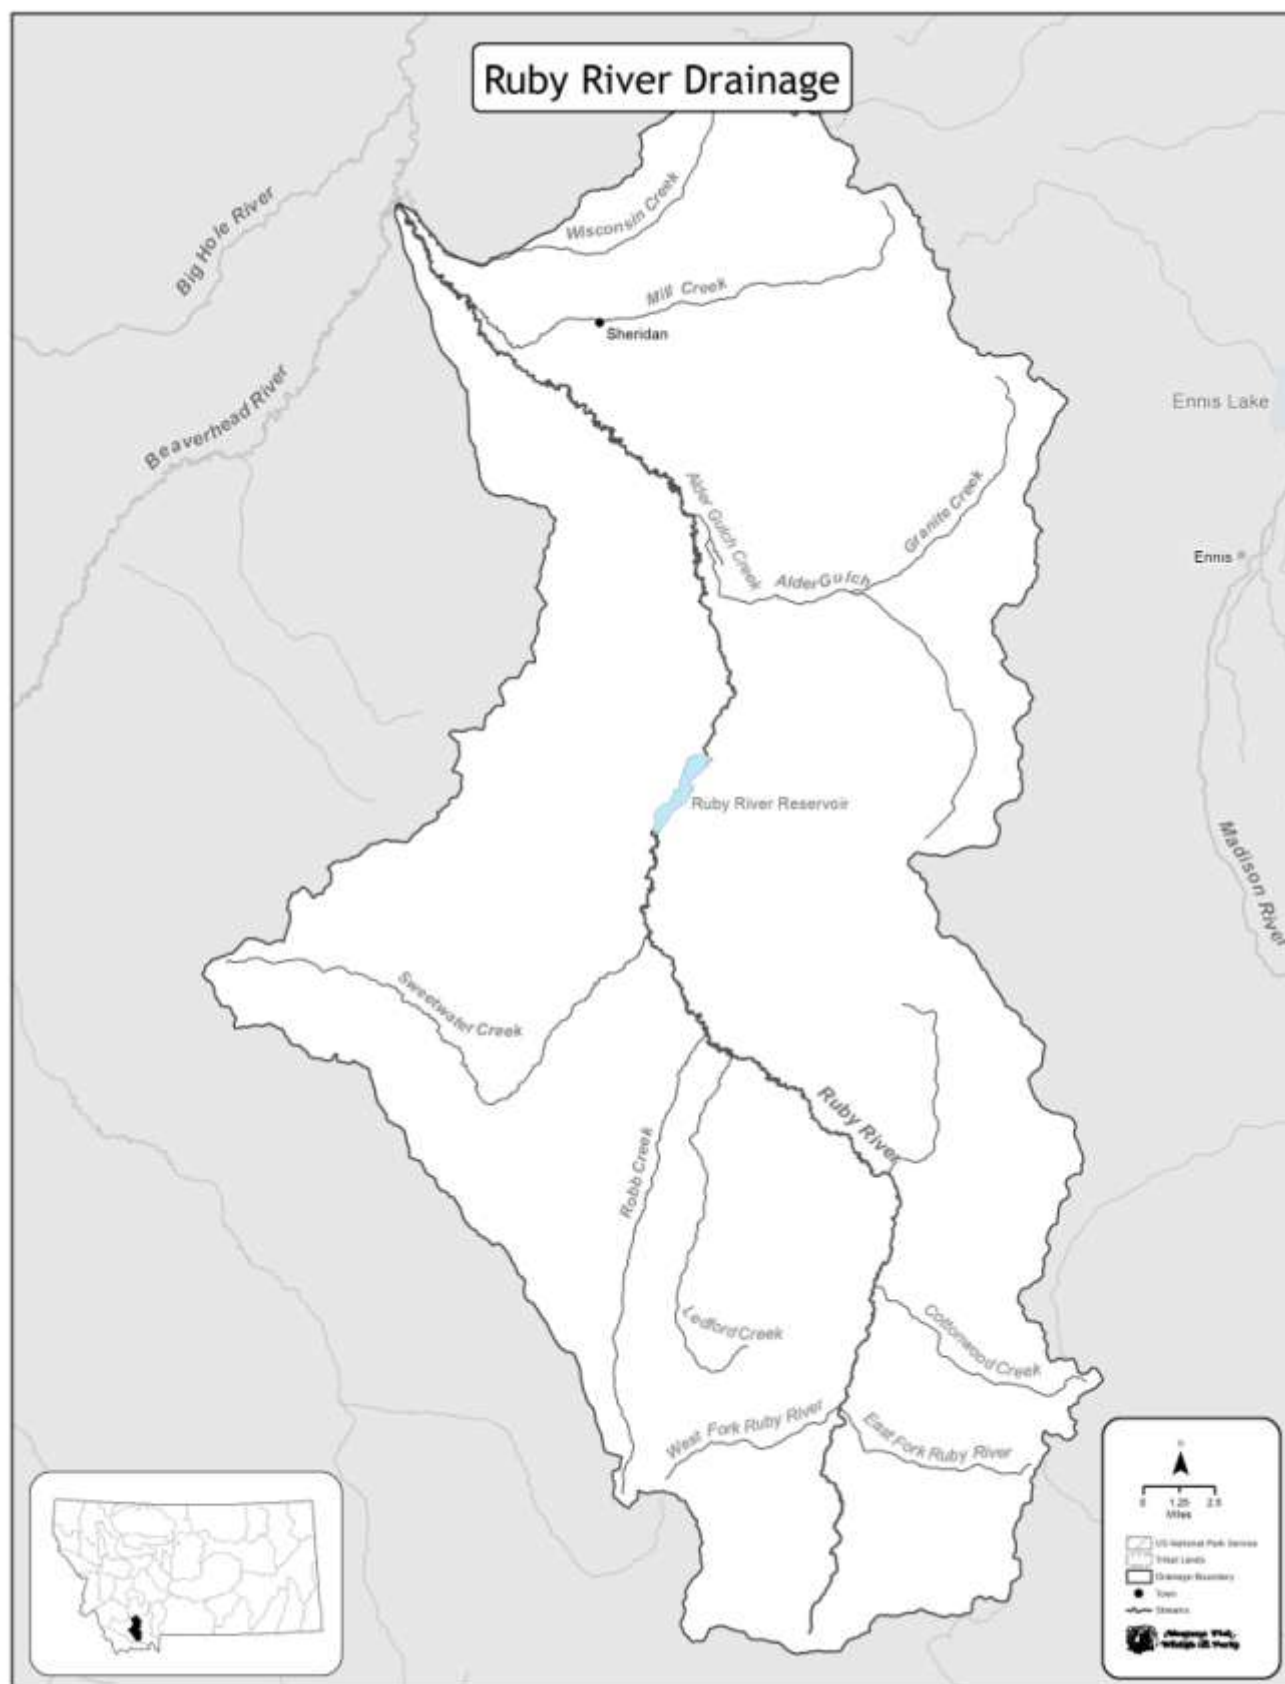

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Elk Lake	207 acres	Lake trout	Wild	Conservation/ Special Regulations	Continue native species conservation to maintain a viable, self-sustaining population
		Burbot	Wild	General	Continue to manage fish density through angler harvest to maintain fish growth
		Arctic grayling	Wild/ Hatchery	Conservation	Continue native species conservation to maintain or create a viable, genetically unaltered, self-sustaining population and, secondarily, to provide angling opportunity. Augment population as necessary to maintain viability and genetic diversity.
		Westslope cutthroat trout	Wild/ Hatchery	General	Continue to manage stocking and harvest to maintain fish growth. Augment population as necessary to maintain viability and genetic diversity.
Habitat needs and activities: Restore and maintain suitable spawning tributary habitats.					
Red Rock Creek	26 miles	Arctic grayling	Wild	Conservation	Continue native species conservation to maintain viable, genetically unaltered, self-sustaining populations
		Yellowstone cutthroat trout, Brook trout	Wild	Special Regulations/ General	Continue to manage to minimize potential impact on viability of Arctic grayling and secondarily for recreational angling
Habitat needs and activities: Reduce delivery of fine sediment, maximize instream flows and riparian habitat quality, and ensure that adequate spawning and overwintering habitats exist.					
Centennial Valley Streams		Arctic grayling, Westslope cutthroat trout	Wild	Conservation	Continue native species conservation to maintain or create viable, genetically unaltered, self-sustaining populations

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Hybridized cutthroat trout, Rainbow trout, Brown trout, Brook trout, Mountain whitefish	Wild	General	Continue to manage fish density through angler harvest to maintain fish growth and, in some instances, to ensure they are not limiting the viability of westslope cutthroat trout populations.
Habitat needs and activities: Survey all tributary streams to determine present habitat quality, stressors and limiting factors, and restoration potential and options. Secure and replicate extant genetically unaltered westslope cutthroat trout populations and create meta-populations of westslope cutthroat trout in accordance with existing conservation plans. Initiate localized and watershed-scale restoration projects to address stressors and limiting factors. Develop instream flow improvements and plans in areas of need.					
Red Rock River	79 miles	Brown trout, Rainbow trout, Mountain whitefish	Wild	Special Regulations	Maintain present numbers and sizes.
Lima Reservoir	4,422 acres	Hybridized cutthroat trout, Burbot	Wild	General	Maintain present numbers and sizes
		Arctic grayling	Wild	Conservation	Continue native species conservation to maintain viable, genetically unaltered, self-sustaining populations
Clark Canyon Reservoir	4,815 acres	Rainbow trout,	Hatchery	Put- Take/ Quality	Continue to manage stocking and harvest to support quality angling opportunity for larger fish
		Brown trout, Burbot	Wild	Special Regulations	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth
Habitat needs and activities: Develop and implement a reservoir management plan that, in conjunction with flow management in the Beaverhead River, optimizes fisheries benefits and irrigation needs. Model relationships between fish planting success and reservoir volume, stock date and method, stocking strain, other fish abundance etc. to develop the most effective stocking strategies.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Mountain Lakes	23 lakes and 148 acres	Westslope cutthroat trout, Hybridized cutthroat trout, Yellowstone cutthroat trout, Rainbow trout, Brook trout,	Wild/ Hatchery	Put- Take/ General	Continue to manage stocking and harvest to maintain fish growth

RUBY RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Ruby River arises from tributaries (its East, West and Middle Forks) located in the Gravelly and Snowcrest mountains of Southwest Montana, and flows in a northwesterly direction for 41 miles through a narrow valley to Ruby Reservoir. Ruby Reservoir, built in 1939, is used for the storage of irrigation water. Downstream from Ruby Dam, the river meanders for approximately 48 miles through an agricultural valley to its confluence with the Beaverhead River. The river drains an area of approximately 935 square miles.

FISHERIES MANAGEMENT

The Ruby River basin contains fish species common to Southwestern Montana. These species include: rainbow trout, brown trout, brook trout, hybrid westslope cutthroat trout, westslope cutthroat trout (primarily in isolated tributaries), mountain whitefish, Arctic grayling, common carp, longnose dace, longnose sucker, Rocky Mountain sculpin, and white sucker. Arctic grayling are historically native to the drainage, but were extirpated. Beginning in the early 2000s, Arctic grayling were restored to the headwater reaches of the Ruby River basin. As of 2011, three years of natural reproduction had been documented, indicating that the population is self-sustaining.

Although the Ruby River basin was historically stocked with hatchery fish, stocking in the rivers and streams was discontinued by the early 1970s, and wild trout management philosophies were initiated. Ruby River Reservoir has been stocked since 1940, primarily with rainbow trout. Yellowstone cutthroat trout were stocked in 1980 through 1983. During most years since 1940, annual stocking of rainbow trout has occurred.

The Ruby River is managed under the Central District Standard regulations for the entire river. Angling is allowed from 1 December through the third Saturday in May for whitefish and catch-and-release for trout using artificial lures and/or maggots only. Upstream from Ruby Reservoir in the mainstem Ruby River, harvest of cutthroat trout is allowed as part of the combined trout limit, as most cutthroat trout within this section are hybridized with rainbow trout. Ruby Reservoir is managed under Central District Standard regulations with no exceptions.

The majority of river angling on the Ruby River occurs downstream from Ruby Dam. Since 2001, total angler effort on the Ruby River from the mouth to Ruby Dam has exceeded 9,000 angler days (over 14,000 in 2007 and 2009). Angler effort upstream of Ruby Dam is approximately 10% of the levels observed downstream from the dam. The number of angler days per year for Ruby Reservoir has varied between 5,600 and 12,397 between 2001 and 2009.

Conservation populations of westslope cutthroat trout exist in some Ruby River tributaries, and are managed as catch-and-release fisheries. Arctic grayling in the Ruby River are also protected from harvest with catch-and-release regulations.

HABITAT

The upper Ruby River valley has a broad floodplain bounded on the west by the steep, mountainous Snowcrest Range and on the east by the gentler, rolling Gravelly Range. Elevations in the upper valley range from 5,900 to 10,500 feet. Lands within the 538 square mile upper drainage are primarily controlled by the USFS and the BLM. Average gradient of the 50-foot wide river channel is fairly constant at 7 feet/1,000 feet.

The upper drainage is comprised of 61% grassland, 12% forest, and 13% subalpine grassland, 12% noncommercial timber and 2% wet meadow and willow bottom. Riparian plant species are primarily willow, alder, birch and grasses and sedges.

The soils of the upper Ruby River valley are highly susceptible to erosion and mass wasting. The overgrazing of these areas in the late 1800s resulted in the formation of extensive rills and gullies. A riparian zone survey conducted in 1976 identified 621 sites with bank instability on the upper 14 miles of river. Livestock and livestock activities were the apparent cause at 46% of these sites.

The deposition of extremely fine sediments in the main river as well as the major tributaries in the upper drainage is a serious problem potentially affecting trout food production and trout eggs. Due to severe sediment deposition, the intergravel water permeability in most trout spawning areas is below the level needed for good survival of trout eggs.

Downstream from Ruby River Reservoir, the Ruby River meanders for 47.9 miles through private grazing and irrigated hay lands within the wide, open Ruby Valley. Channel and bank alterations are common within this stretch. As of 1973, a total of 280 river bank and 53 channel alterations were documented. These projects comprised 17 and 8 percent of the reach length, respectively.

A major habitat concern in the lower Ruby River is excessive sedimentation. Overgrazing of the upper drainage, coupled with the fragile soil types of the area have resulted in erosion problems and the accumulations of vast sediment deposits in Ruby Reservoir. During periods of extreme drawdown, the discharge from Ruby Reservoir is excessively turbid. This is attributed to bottom sediments being drawn into suspension by currents generated on the reservoir floor. The destruction of stream bank vegetation by livestock has further aggravated the sediment problem downstream from Ruby Reservoir.

Dewatering of the Ruby River downstream from Ruby Reservoir is a serious habitat issue. When water is stored in Ruby Reservoir during the winter months, flows downstream from the dam are greatly reduced. Portions of the river are also subject to severe dewatering during the summer irrigation season. During the droughts of 1985 and 1987, stretches of the Ruby River downstream from the reservoir were totally dewatered, causing major fish kills.

FISHING ACCESS

Five fishing access sites are located on the Ruby River. These sites are located from the Ruby Dam downstream.

SPECIAL MANAGEMENT ISSUES

In 2007, Montana Fish, Wildlife & Parks and partners (the BLM, USFWS, USFS, Montana Council Trout Unlimited, Montana Chapter American Fisheries Society, Yellowstone National Park, Montana Arctic Grayling Recovery Program, NRCS, and DNRC) all cosigned a Memorandum of Understanding (MOU) concerning Montana Arctic Grayling Conservation. This MOU defines responsibilities and procedures agreed to by all signatory agencies conserving conservation actions to benefit Arctic grayling in Montana (including the Ruby River).

The Ruby River drainage is also home to several conservation populations of westslope cutthroat trout providing opportunities to conserve this native species in the drainage. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of non-native species and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of competition and hybridization from non-native species. The long-term goal of cutthroat conservation in the Ruby is to have 20% of the historically occupied habitat restored to cutthroat trout.

FISHERIES MANAGEMENT DIRECTION FOR RUBY RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Ruby River Upstream of Ruby Reservoir	48.2 miles	Arctic grayling	Wild	Conservation	Continue native species conservation to maintain viable, self-sustaining populations
		Hybridized cutthroat trout, Rainbow trout, Brown trout, Brook trout, Mountain whitefish	Wild	General/ Special regulations	Maintain present numbers and sizes. Consider increasing harvest to reduce numbers if necessary to maintain fish growth.
Ruby Reservoir	943 acres	Rainbow trout	Hatchery	Put-Grow-Take	Continue to manage stocking and harvest to minimize density dependant reductions in fish growth
		Brown trout	Wild	General	Maintain present numbers and sizes. Consider increasing harvest to reduce numbers if necessary to maintain fish growth.
Habitat needs and activities: Maintain reservoir elevations in accordance with existing management plan. Model relationships between fish planting success and reservoir spilling duration, volume, etc. to develop the most effective stocking strategies.					
Ruby River Downstream of Ruby Reservoir	45.5 miles	Rainbow trout, Brown trout, Mountain whitefish	Wild	General	Maintain present numbers and sizes. Consider increasing harvest to reduce numbers if necessary to maintain fish growth.
Habitat needs and activities: Maintain instream flow in accordance with existing flow management plans. Determine whether changes in reservoir management will improve the quality of the downstream fishery. Initiate localized and watershed-scale restoration projects to achieve TMDL compliance on 303d listed streams.					
Ruby River Tributaries	342 miles	Westslope cutthroat trout	Wild	Conservation	Continue native species conservation to maintain or create viable, genetically unaltered, self-sustaining populations
		Hybridized cutthroat trout, Rainbow trout, Brown trout,	Wild	General	Maintain present numbers and sizes. Consider increasing harvest to reduce numbers if necessary to maintain fish growth and in some instances, to ensure they are not limiting the viability of westslope cutthroat trout populations.

Mountain Lakes	9 lakes and 65 acres	Westslope cutthroat trout, Hybridized cutthroat trout, Yellowstone cutthroat trout, Rainbow trout, Brook trout,	Wild/ Hatchery	Put-Take/ Wild	Maintain present numbers and sizes. Consider increasing harvest to reduce numbers if necessary to maintain fish growth.

BEAVERHEAD RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Beaverhead River originates at the outlet of Clark Canyon Reservoir, an irrigation storage facility constructed by the BOR in 1964, and flows 79.5 miles before joining the Big Hole River to form the Jefferson River. Directly downstream from Clark Canyon Dam, the river flows through a canyon for 16 miles, before entering the broad, open Beaverhead Valley. At Point of Rocks, the river passes through a narrow constriction, then continues for about 20 miles through a wide, gently sloping valley to its confluence with the Big Hole River. The river drains an area of approximately 5,000 square miles. A large portion of the drainage consists of rugged mountains ranging from 9,000 to 11,000 feet in elevation. The river elevation at the dam outlet is 5,450 ft, and at the mouth is 4,600 ft. Major tributaries entering the river in downstream progression are: Grasshopper, Rattlesnake and Blacktail Deer creeks, and the Ruby River.

FISHERIES MANAGEMENT

The Beaverhead River basin contains fish species common to Southwestern Montana. These species include: rainbow trout, brown trout, brook trout, hybrid westslope cutthroat trout, westslope cutthroat trout (primarily in isolated tributaries), mountain whitefish, burbot, common carp, longnose dace, longnose sucker, Rocky Mountain sculpin, and white sucker.

Although the Beaverhead River basin was historically stocked with hatchery fish, stocking in the rivers and streams was discontinued by the early 1970s, and wild trout management philosophies were initiated. Between the 1930s and 1960s, the Beaverhead River was stocked with rainbow trout, cutthroat trout (undesignated as to which sub-species), and brown trout. Arctic grayling have also been stocked into the Ruby River basin during the late 1990s and the early 2000s as part of a FWP restoration program. The stocking was discontinued in 2002, and no natural reproduction has been subsequently detected through annual sampling. Rainbow trout have been stocked annually into Clark Canyon Reservoir since 1964.

The Beaverhead River is managed under Central District Standard regulations for the entire river with a few exceptions. Only one rainbow trout may be counted in the combined trout limit, and angling is closed from Clark Canyon Dam to Pipe Organ Bridge from 1 December until the third Saturday in May.

Angling pressure is high on the Beaverhead River downstream from Clark Canyon Dam. Angling effort has varied from 14,574 angler days in 2001 to 38,706 angler days in 2009. On average, over half of the angler days logged on the Beaverhead River are from non-resident anglers.

HABITAT

Throughout much of the Beaverhead River's length, it is confined to a single channel. Mean channel widths range from about 83 feet near the dam to about 93 feet near the mouth. The gradient is gentle, averaging 12 feet per mile. Willow is the dominant bank vegetation. In the upper river, the streambed consists primarily of rubble, gravel and sand. In addition to the above,

silt is a common component of the streambed in the lower river. Fish cover primarily consists of submerged and overhanging bank vegetation, undercut banks, and long, deep pools.

Clark Canyon Reservoir and irrigation diversions affect the flow pattern of the Beaverhead River. Prior to the construction of the reservoir, much of the lower river was severely dewatered during the summer irrigation season. In general, reservoir management has resulted in higher flows in the lower river during the historically low flow months of May, July, August and September. However, much of the lower 64 miles still suffer from dewatering. In recent years, sections of the lower river have been totally dry. Massive withdrawals of irrigation water have virtually eliminated high water flows in the lower river. During periods of drought, the upper river is now severely affected by low flow releases during the non-irrigation season when water is being stored for the following year.

FISHING ACCESS

The Beaverhead River primarily flows through private lands. Access to the river is readily obtained through some private lands, publicly owned access sites, and at bridge crossings. Floating is popular during the fishing and waterfowl seasons.

Seven FASs exist on the Beaverhead River between Clark Canyon Dam and Dillon, Montana. Opportunities for developing additional Fishing Access Sites downstream of Dillon are a high priority.

SPECIAL MANAGEMENT ISSUES

Montana Fish, Wildlife & Parks works closely with the BOR on operations of Clark Canyon Dam, in particular concerning the need for greater overwinter flows downstream of the dam.

Given the popularity of the Beaverhead River, angling is managed with social rules (regulations) to minimize social crowding issues. These rules prohibit angling by non-resident anglers and outfitters during particular times of the year and in specific sections.

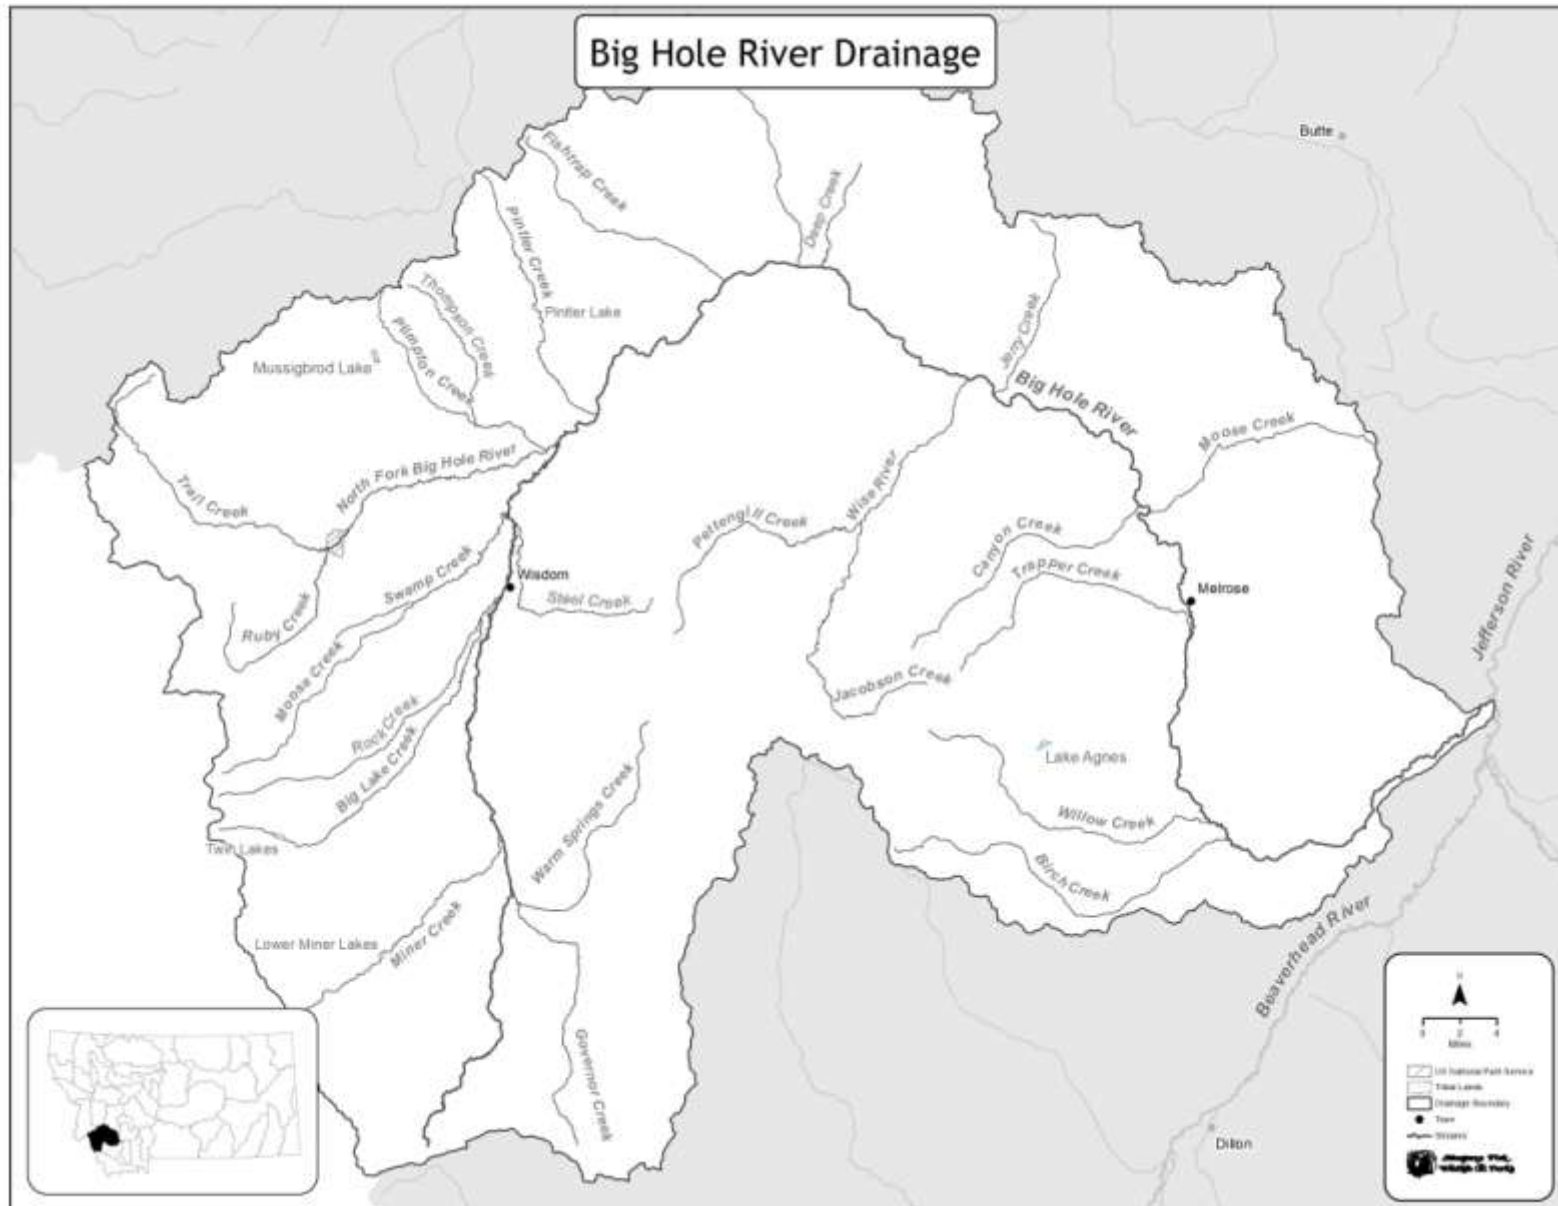

The Beaverhead River drainage is home to several conservation populations of westslope cutthroat trout providing opportunities to conserve this native species in the drainage. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of non-native species and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of competition and hybridization from non-native species. The long-term goal of cutthroat conservation in the Beaverhead is to have 20% of the historically occupied habitat restored to cutthroat trout.

FISHERIES MANAGEMENT DIRECTION FOR THE BEAVERHEAD DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Beaverhead River	75 miles	Brown trout, Rainbow trout	Wild	Quality/ Special regulations	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth
		Mountain whitefish	Wild	General	Continue to manage harvest to support viable populations
Habitat needs and activities: Develop an instream flow management plan that optimizes fisheries benefits and irrigation needs to secure 1) improved winter flows upstream of Barretts Diversion and 2) improved summer flows downstream of Barretts Diversion. Develop a sediment transport model to determine the magnitude and duration of flows required to convey fine sediment through the reach between Clark Canyon Dam and Barretts Diversion. Develop and implement an alternative to reduce or eliminate the effects of sediment delivery from the North Fork of Clark Canyon Creek.					
Beaverhead River Drainage Tributaries	491 miles	Westslope cutthroat trout	Wild	Conservation	Continue native species conservation to maintain or create viable, genetically unaltered, self-sustaining populations
		Hybridized cutthroat trout, Rainbow trout, Brown trout, Brook trout, Mountain whitefish	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth. Modify as necessary to ensure they are not limiting the viability of westslope cutthroat trout populations
Habitat needs and activities: Secure and replicate extant genetically unaltered westslope cutthroat trout populations and create meta-populations of westslope cutthroat trout in accordance with existing conservation plans. Initiate localized and watershed-scale restoration projects to achieve TMDL compliance on 303d listed streams. Develop instream flow improvements and plans in areas of need.					
Poindexter Slough	6 miles	Brown trout, Rainbow trout, Mountain whitefish	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth
Habitat needs and activities: Reconfigure upstream headgate to the Beaverhead River to allow adequate flow to support 1) fisheries and irrigation needs and 2) periodic flushing flows to mobilize fine sediment through the system to maintain high quality habitat. Implement active channel restoration techniques to size channel appropriate to contemporary flow volumes to create self-maintaining high quality habitat. Develop a flow management plan that optimizes fisheries benefits and irrigation needs to 1) maintain minimum instream flows during summer, 2) formalize use of periodic flushing flows to mobilize convey fine sediment through the system and, 3) maximize reliance on accreted flows to enhance the spring creek character of Poindexter Slough to the extent possible.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Mountain Lakes	12 lakes 135 acres	Westslope cutthroat trout, Hybridized cutthroat trout, Yellowstone cutthroat trout, Rainbow trout, Brook trout,	Wild/ Hatchery	Put- Take/ General	Continue to manage stocking and harvest to maintain fish sizes and numbers

BIG HOLE RIVER DRAINAGE

GENERAL DESCRIPTION

The Big Hole River originates in the outlet of Skinner Lake at an elevation of 7,340 ft in the Beaverhead Mountains of southwest Montana. From its modest beginnings, the river gathers volume and velocity due to numerous tributaries along its 115 mile course until its confluence with the Beaverhead River near Twin Bridges at an elevation of 4,600 ft. The Big Hole drainage encompasses approximately 2,476 square miles. The river drains the Beaverhead Mountains on the west and the south side the Anaconda-Pintler Range on the north. The river also collects water from the East and West Pioneer Mountains which includes the largest tributary to the Big Hole, the Wise River. The average annual discharge of the river recorded at Melrose since the early 1900s is 1,117 cfs. The river is not dammed although there were significant attempts in the 1960s to construct a dam downstream of the town of Glen at the “Notch”. From the high mountain meadows of its headwaters to the cottonwood bottoms of the lower river, the Big Hole is free-flowing and one of the most scenic rivers in Montana.

Major tributaries to the Big Hole River include the Wise River and the North Fork Big Hole River. There are 106 named high mountain lakes in the Big Hole Drainage, as well as low-land lakes such as Mussigbrod, Miner, Twin and Pintler Lakes which are accessible by vehicle and have native components to their fisheries. Outdoor recreation and angling in particular are important activities that occur in the Big Hole. The river receives significant angling pressure, particularly in the middle and lower reaches. Approximately half of this fishing pressure is from non-resident anglers. There many outfitters in local communities and from areas like Butte, Dillon, Twin Bridges and Ennis that frequent the Big Hole and contribute to the local economy. Because of the importance of agriculture in the valley and the importance of irrigation, the river and many of its tributaries can become dewatered, particularly in dry years. One of the more recent changes that has occurred on the Big Hole is the dividing of larger ranches, particularly in the middle and lower reaches of the river, into smaller parcels including subdivisions and the development of seasonal housing. Such developments have been the cause of concern for the fisheries and river functions because large, expensive homes are being constructed in areas of the river prone to natural channel migration and as the river approaches homes, bank stabilization is often proposed.

In recent years there has been substantial interest in protecting the Big Hole River, the pristine nature of the valley, its fishery and the way of life of the people that call the valley home. Groups such as the Big Hole Watershed Committee and the Big Hole River Foundation among others have collaborated with government agencies, ranchers, sportsmen and other groups to develop conservation plans and perform projects to protect and restore the natural resources of the Big Hole. Some of these major accomplishments include the Big Hole Drought management plan, Arctic grayling habitat restoration, and improvement of irrigation efficiency. These groups have been highly successful at using collaboration to accomplish common conservation goals.

FISHERIES MANAGEMENT

The native fishery in the Big Hole River Drainage was westslope cutthroat trout, Arctic grayling, lake trout, mountain whitefish, white, longnose and mountain sucker, Rocky Mountain sculpin, longnose dace and burbot. Today the mainstem river contains fish species common to Southwestern Montana including rainbow trout and brown trout. Mountain whitefish and other native suckers and minnows are also common, but cutthroat trout and Arctic grayling are rare. Brook trout are the most common trout species in the upper river from Jackson through Wisdom and in most tributary streams. The Big Hole is a Blue Ribbon trout fishery and its trout population trends are closely monitored. The Upper Big Hole River drainage contains the last known fluvial Arctic grayling population in the Lower 48 States. Active conservation programs are ongoing to enhance habitat conditions for this unique species in the Big Hole River. Mussigbrod, Miner and Pintler lakes have self-sustaining populations of Arctic grayling that are assumed to be native. Burbot are common in the river, some tributary streams and lower elevation lakes. Twin Lakes also has a native population of lake trout. There are 106 mountain lakes in Big Hole that contain fisheries. These fisheries include rainbow, brook, Yellowstone cutthroat, westslope cutthroat and golden trout, hybrids between rainbow and cutthroat trout, Arctic grayling and longnose suckers.

Common to many Southwestern Montana rivers, fish were stocked in the Big Hole River beginning in the early 1900s into the late 1970s when wild trout management philosophies were instituted. Prior to 1974 the Big Hole received annual plants of catchable size hatchery rainbow trout similar to most rivers of the region. Research by the Department on the Madison River and Odell Creek in the early 1970s demonstrated that these hatchery plants actually depressed trout numbers and that these rivers could support higher trout populations based on a wild trout fishery without hatchery support. In 1974, the stocking of hatchery trout was virtually eliminated in the Big Hole in favor of wild trout management. The results of that action were an increase in both rainbow and brown trout abundance to more than twice their numbers achieved with stocking despite a substantial increase in angling pressure. Species which were stocked into the Big Hole River include rainbow trout, Arctic grayling, brown trout, kokanee salmon, and undesignated cutthroat trout. Beginning in the late 2000s, Arctic grayling have been stocked into Rock Creek in the upper Big Hole valley using remote streamside incubators (RSI) to reintroduce the species into Rock Creek after habitat improvements. Similarly, westslope cutthroat trout have been stocked into tributary streams of the Big Hole using RSIs as part of efforts to conserve this native species.

Many mountain lakes were stocked with trout and grayling in the early 1900s. Active stocking of mountain lakes in the Big Hole still occurs in lakes that do not support natural reproduction. Of the 106 lakes that contain fish, 30 are supported through active stocking while the rest are supported by natural reproduction. Fish stocking in alpine lakes in the Big Hole is done on a biannual basis and is performed primarily using a helicopter. Prior to 2006, Yellowstone cutthroat trout were the primary species stocked into mountain lakes, but since then the native westslope cutthroat trout has been stocked instead. Only one lake in the Big Hole drainage is currently stocked with golden trout.

Fishing regulations on the Big Hole River are complicated and diverse. In 1981 the Big Hole River from Divide to Melrose was placed under special regulations including a slot limit where trout from 13-22 inches had to be released and anglers were allowed to keep only 3 fish less than

13 inches and 1 fish over 22 inches. Angling gear was also restricted to flies and artificial lures. The public supported these regulations because their thought was that harvest was negatively affecting the numbers of larger fish in this reach of river. The remainder of the river upstream and downstream of this reach remained under the Central Fishing District standard limit of 5 fish with only 1 fish over 18 inches. In 1986 the same regulations as previously adopted for the Divide to Melrose section were also adopted for the Dickie Bridge to the Divide section of the river. After adoption of these regulations, trout numbers increased but quickly plateaued within 3-5 years. The slot limit for trout was dropped in the early 2000s for the Dickie Bridge to Melrose section, but the artificials-only rule remains. The entire river is closed from December 1 through the third Saturday in May to the harvest of trout (with the exception of brook trout in the headwaters), but there is an extended season for whitefish during the winter.

Many of the current fishing regulations on the Big Hole are associated with social issues (crowding and conflict between residents and non-residents or between residents and outfitters) and have little biological basis. Specific sections of the river are closed each day of the week from the third Saturday in May through Labor Day to outfitting and sections are closed to non-resident float fishing on the weekend days. Upstream from Dickey Bridge, harvest of trout is encouraged to help minimize impacts to Arctic grayling, and no size restriction is in place on the combined trout limit. Big Hole River tributaries upstream from Divide Bridge are managed for year-round brook trout fishing to minimize impacts to Arctic grayling.

Angler use of the Big Hole River is high. Over the past decade estimates have ranged from 33,121 angler days in 2001 to 77,579 angler days in 2009. Use of the Wise River has varied over the last decade from a low of 2,412 angler days in 2007 to a high of 4,322 angler days in 2009.

HABITAT

Irrigation withdrawal within the Big Hole River drainage can cause periods of low flow and high water temperatures, which can be stressful to fish populations. Sections of the river are listed as impaired by the Montana Department of Environmental Quality because of high stream temperatures. Irrigation practices can also lead to reduced habitat connectivity (channel-wide pin and plank diversions) and entrainment (loss of fish in irrigation ditches). To address low flows and high temperatures and the effects they have on the fishery, the Big Hole Watershed Committee working cooperatively with water users has adopted a voluntary drought management plan with specific stream flow and temperature triggers. This plan is aimed at maintaining minimum flows and asking water users to voluntarily reduce withdrawals from the river to improve flows. There are multiple drought management sections on the Big Hole River with specific flow and temperature triggers. When those triggers are met water users are asked to reduce their water use and angling is also restricted. Those currently enrolled in the CCAA and have completed an approved Site-Specific Plan are required to comply with reductions in diversions as stated in each individual plan. Landowners that have not completed Site-Specific Plans reduce irrigation diversions on a temporary agreement until the Site-Specific plan is completed or approved. The reduction in water use by irrigators and municipalities has resulted in increased river flows during drought conditions.

Land management activities in the Big Hole River basin (grazing, willow removals, etc) have caused problems with stream form and function, as well as stream shading. Because the Big Hole River flows primarily through private land, cooperative habitat improvement projects with

landowners is essential to improving fisheries habitat. To date, over 200 habitat improvement projects have been completed on private land in the Big Hole valley. These projects have been focused primarily in the upper valley and have improved riparian health, instream flows, and habitat connectivity and have reduced or eliminated entrainment. Through grazing and instream flow agreements, the Big Hole River and tributaries are showing healthier riparian habitat conditions and improved stream flows, especially during critical periods (spawning and late season). Replacing non-functioning irrigation infrastructure (headgates and diversions), installing fish ladders and fish screens has improved irrigation efficiency, increased connectivity and reduced fish loss.

Streambank stabilization has significantly altered the function of the lower river, particularly downstream of Notch Bottom, and remains a significant threat to river function. In areas of the lower river with a wide floodplain, the river is prone to natural channel migration and channel evulsions, and abandonments are common. These natural channel changes are important in maintaining aquatic habitats in these types of rivers. However, when these channel changes affect irrigation water withdrawals or loss of land and potentially loss of structures, then bank stabilization is often proposed. Groups such as the Big Hole Watershed Committee and county governments are seeking a collaborative approach to ensuring natural river function and responsible development of the Big Hole Valley. The Big Hole was one of the first rivers to have a set-back rule where no structures could be built within 100 ft of the river in all four counties in the drainage. Further collaborative efforts are being made to better understand the floodplain of the river and guide future development in these areas.

The lower section of river from Notch Bottom to the confluence with the Beaverhead River is also a focus area for FWP with the hope of improving the fishery in this reach. The density of trout in this reach of river is only half of that present in the river only 10 miles upstream. Studies indicate that the limiting factors affecting the fishery are suitable spawning and rearing areas and low summer flows due to irrigation withdrawal. The lack of spawning and rearing areas is likely due to the lack of tributary streams in this reach and the significant bank stabilization projects conducted over the past 50 years. Bank stabilization in this reach results in a less diverse river channel and causes less natural channel migration and fewer side channels. These side channels are important spawning and rearing areas because they often contain more complex habitats with log jams and other structure used by juvenile fish and they also contain smaller substrates suitable for spawning. Studies are being conducted to determine if it is possible to create off-channel spawning areas in the lower reach of the river utilizing existing spring creeks and irrigation systems. Also, efforts are underway to work cooperatively with landowners and irrigators and the Big Hole Watershed Committee to increase flows during summer to benefit the fishery.

FISHING ACCESS

FWP has 13 fishing access sites on the Big Hole River from Fishtrap Creek downstream. Additional federal and private (Anaconda Sportsmen) fishing access sites exist within this vicinity. Public land and public road crossings throughout the valley provides fishing access at various points.

SPECIAL MANAGEMENT ISSUES

The Big Hole River is home to the last known native fluvial grayling population in the contiguous United States. A decline in the abundance and distribution of the population was first documented in the 1980s, resulting in increased efforts to understand population dynamics, identify critical habitats, and implement conservation projects to address factors limiting the population. These efforts have been directed primarily through the Arctic Grayling Recovery Program (AGRP) and the Candidate Conservation Agreement with Assurances for Fluvial Arctic Grayling in the Upper Big Hole River (Big Hole CCAA).

The Big Hole CCAA was developed to help alleviate private property concerns associated with the potential ESA listing of Montana grayling and to generate support from private landowners to improve habitat conditions for grayling throughout the Big Hole CCAA project area. The project area includes the Big Hole River watershed from Dickie Bridge upstream to the headwaters. Under this agreement the USFWS issued FWP an ESA section 10(a)(1)(A) Enhancement of Survival Permit, which gave FWP the authority to enroll non-federal landowners within the project area. Currently there are 33 enrolled non-federal landowners who are provided incidental take coverage and regulatory assurances once they sign (along with the USFWS and FWP) a Certificate of Inclusion and a site-specific conservation plan for the enrolled property. Site-specific conservation plans are developed for each enrolled landowner by an interdisciplinary technical team made up of individuals representing the Big Hole CCAA partnering agencies (FWP, DNRC, NRCS, and USFWS). Conservation measures outlined in the Big Hole CCAA document are addressed by in each site-specific plan by implementing actions that: 1) improve stream flows; 2) improve and protect the function of riparian habitats; 3) identify and reduce or eliminate entrainment threats to grayling; and 4) remove barriers to grayling migration.

In 2007, FWP, BLM, USFWS, USFS, Montana Council Trout Unlimited, Montana Chapter American Fisheries Society, Yellowstone National Park, Montana Arctic Grayling Recovery Program, the USDA Natural Resource Conservation Service, and DNRC and Conservation all cosigned a Memorandum of Understanding (MOU) concerning Montana Arctic Grayling Conservation. This MOU defines responsibilities and procedures agreed to by all signatory agencies conserving conservation actions to benefit Arctic grayling in Montana.

The Big Hole is also home to more conservation populations of westslope cutthroat trout (39) than any other drainage in the upper Missouri River providing several opportunities to conserve this native species in the drainage. Management for nonnative trout (brown and rainbow trout) will continue to be emphasized in the lower mainstem river while opportunities for cutthroat conservation will be pursued in some tributary streams. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of nonnative species and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of competition and hybridization from non-native species. The long-term goal of cutthroat conservation in the Big Hole is to have 20% of the historically occupied habitat restored to cutthroat trout. The estimated amount of stream in the Big Hole drainage historically occupied by cutthroat trout is 1,748 miles and therefore the long-term goal of cutthroat conservation in the Big Hole is to have approximately 350 miles of stream occupied by secure populations of westslope cutthroat trout.

FISHERIES MANAGEMENT DIRECTION FOR BIG HOLE RIVER DRAINAGE

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Big Hole River and Tributaries - Headwaters to Dickey Bridge	93 miles	Arctic grayling, Lake trout, Mountain whitefish, Burbot, Westslope cutthroat trout	Wild	Conservation	Continue native species conservation to maintain a viable, self-sustaining population
		Brook trout, Rainbow trout, Brown trout, Hybridized cutthroat trout	Wild	General/ Special Regulations	Continue to manage to minimize potential impact on viability of Arctic grayling and secondarily for recreational angling
Habitat needs and activities: Continue to improve stream flows, improve riparian habitats, improve stream channel form and function, continue to prevent fish entrainment into irrigation ditches.					
Big Hole River and Tributaries - Dickey Bridge to Mouth	72 miles	Brook trout, Rainbow trout, Brown trout, Hybridized cutthroat trout	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth and, in some instances, to ensure they are not limiting the viability of westslope cutthroat trout or Arctic grayling populations.
		Westslope cutthroat trout, Mountain whitefish	Wild	Conservation	Continue native species conservation to maintain a viable, self-sustaining population
Habitat needs and activities: Implement and refine drought management plans to minimize impacts on fish populations. Continue to look for opportunities to increase river flows and develop spawning habitat in the Big Hole River downstream from Notch Bottom FAS. Pursue Fishing Access acquisition near High Road Bridge at Twin Bridges and between East Bank FAS and Jerry Creek FAS.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Wise River and Tributaries	25 miles	Brook trout, Rainbow trout, Brown trout, Hybridized cutthroat trout	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth and, in some instances, to ensure they are not limiting the viability of westslope cutthroat trout.
		Westslope cutthroat trout, Mountain whitefish	Wild	Conservation	Continue native species conservation to maintain a viable, self-sustaining population
Habitat needs and activities: Develop drought management plan for Wise River. Pursue opportunities for habitat improvements in river section from Pettengill Creek to confluence with Big Hole which was affected by thePettingill Dam breach in 1920's. Determine if Wise River could serve as possible Arctic graying reintroduction area.					
Mountain Lakes		Westslope cutthroat trout, Hybridized cutthroat trout, Yellowstone cutthroat trout, Rainbow trout, Brook trout, Golden trout	Wild	Put- Take/ General	Monitor mountain lakes. Continue to manage stocking and harvest to maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth. Where appropriate pursue opportunities to expand golden trout into mountain lakes where such management would not conflict with cutthroat conservation.
Cutthroat Conservation Streams	350 miles	Westslope cutthroat trout and other native fish species	Wild/ Transport	Conservation	Secure populations in tributary streams by removing non-native fish upstream of fish barriers and restoring westslope cutthroat trout.
Habitat needs and activities: Work with Forest Service, BLM and DRNC and private landowners on grazing regimes to minimize livestock impacts to streams. Work on water conservation projects to improve stream flows. Construct or utilize natural fish barriers to preclude non-native fish movement upstream. Remove non-native fish and restore WCT upstream.					

BOULDER RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Boulder River is formed at the confluence of its South and West Forks (elevation 6,740 feet) on the east side of the Continental divide north of Butte, Montana. It flows east to Boulder Montana, then south to its confluence with the Jefferson River near Cardwell, Montana. It is 78 miles in total length. Only the upper 26 percent of streams are within the boundary of the Beaverhead-Deerlodge National Forest. Major tributaries—progressing downstream—are: Lowland, Bison, Basin, Cataract and Muskrat creeks and the Little Boulder River. The Boulder River drains an area of approximately 763 square miles.

Cold Springs enters the Boulder River about 10 miles upstream of the confluence with the Jefferson River, and water quality improves significantly in this reach. In addition to supporting a quality resident fishery, large numbers of spawning brown trout from the Jefferson River enter this reach of the Boulder River during the fall.

FISHERIES MANAGEMENT

The Boulder River is managed as a wild trout fishery, emphasizing natural reproduction. The basin is also suitable for westslope trout recovery efforts in many locations. The Boulder River drainage contains fish species common to southwestern Montana. The native species found here include westslope cutthroat trout, mountain whitefish, mountain sucker, longnose dace, longnose sucker, Rocky Mountain sculpin, and white sucker. Nonnative species are the rainbow trout, brown trout, brook trout, and common carp. Hybrids of rainbow trout and westslope cutthroat trout are also found in the drainage.

Fish stocking records for the Boulder River are documented to begin in the 1920s and continued through the early 1970s when wild trout management philosophies were instituted. Beginning in the late 1920s, undesignted cutthroat trout, rainbow trout, brook trout, brown trout and arctic grayling were stocked. Between the early 1950s and early 1970s, only rainbow trout were stocked into the Boulder River drainage.

The fishing regulations for trout in the Boulder River drainage are covered by the Central District Standard regulations with the exception of a seasonal closure (1 November through the 3rd Friday in May) to protect spawning trout (from the Jefferson River) in the lower reaches of the Boulder River. Over the past decade, angler use of the Boulder River has varied from 2,962 angler days in 2001 to 11,009 angler days in 2009. The major tributaries (East Fork Boulder, Little Boulder River, and South Fork Boulder River) receive little angling use annually.

HABITAT

The Boulder River has a mean gradient of 33.7 feet per mile. At the Beaverhead-Deerlodge National Forest boundary above Basin, the stream averages 47.4 feet in width at the spring flow levels. The river upstream from Boulder, Montana has a narrow floodplain, a high elevation and steep gradient. Riparian vegetation primarily consists of willows, alders, conifers, and to a lesser extent, cottonwoods and aspens. The reach of river downstream from Boulder has a wider

floodplain through which the river meanders, a lower elevation and a more gradual gradient. Riparian vegetation primarily consists of cottonwoods, aspens and willows.

Flows in the river depend primarily on snowpack in the mountains, although a number of large springs add to the flow in the lower valley. The major use of water from the Boulder River below Boulder, Montana is for agricultural purposes.

Extensive portions of the Boulder River have been relocated as a result of mining, agricultural, road, and railroad building activities. Portions of the upper river channel (town of Boulder to Bernice) were relocated to accommodate Interstate 15. In addition, riprapping of the banks and vegetation removal has affected other stretches.

FISHING ACCESS

Angling access is readily available in the headwaters due to the dominance of federal land ownership (USFS, BLM), and public roads located along the river upstream of Boulder provide numerous locations to gain access to the river. From the town of Boulder to the confluence with the Jefferson River, access is generally limited to county road bridges. There are no FASs administered by FWP on the Boulder River, but the Candlestick Ranch near Cardwell provides a unique access opportunity provided by Golden Sunlight Mine in coordination with FWP.

SPECIAL MANAGEMENT ISSUES

Hard rock mining for metallic minerals in the Boulder River drainage was extensive in the late 1800s and early 1900s. This past mining is still affecting the river downstream from Basin, Montana where heavy metals emanating from acid mine seeps and mill tailings cause a major water quality problem. Stream sediments in the river channel and floodplain contain high concentrations of zinc, copper and lead, extending some 25 miles downstream from the source areas. In the Boulder River downstream from the town of Basin, depressed standing crops of trout have been associated with higher metals concentrations in the river. Other studies from the 1970s showed that metals pollution and stream sedimentation were affecting the distribution and abundance of aquatic insects in the Boulder River.

The Boulder River drainage is also home to several conservation populations of westslope cutthroat trout providing opportunities to conserve this native species in the drainage. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of nonnative species and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of competition and hybridization from non-native species. The long-term goal of cutthroat conservation in the Boulder is to have 20% of the historically occupied habitat restored to cutthroat trout.

FISHERIES MANAGEMENT DIRECTION FOR BOULDER RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Boulder River and Tributaries (Headwaters to Boulder)	35 miles	Brook trout, Rainbow trout, Mountain whitefish	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth.
		Westslope cutthroat trout	Wild	Conservation/ Special Regulations	Continue native species conservation to maintain or create viable, genetically unaltered, self-sustaining populations
Habitat needs and activities: Initiate mine reclamation to improve water quality and coordinate with Forest Service activities.					
Boulder River and Tributaries (Boulder to Cold Springs)	35 miles	Rainbow trout, Brown trout, Mountain whitefish	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth
Habitat needs and activities: Continue to improve instream flow, by looking for opportunities to lease water or improve efficiency in irrigational infrastructure and methods.					
Boulder River and Tributaries (Cold Springs to Confluence with Jefferson River)	10 miles	Brown trout, Rainbow trout	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth. Continue to protect spawning runs

JEFFERSON RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Jefferson River flows for 84 miles from its origin at the junction of the Big Hole and Beaverhead rivers to its mouth at Three Forks, Montana where it joins the Madison and Gallatin rivers to form the Missouri River. Much of the Jefferson River is braided, particularly in the area near Three Forks where many islands and side channels exist. During the irrigation season, virtually all of the tributaries to the Jefferson are diverted before reaching the river. The Boulder River is the only tributary to contribute a significant volume of flow during the high-water period.

FISHERIES MANAGEMENT

The Jefferson River basin contains fish species common to Southwestern Montana. These species include: rainbow trout, brown trout, brook trout, hybrid westslope cutthroat trout, westslope cutthroat trout (primarily in isolated tributaries), mountain whitefish, common carp, longnose dace, longnose sucker, Rocky Mountain sculpin, mountain sucker, and white sucker. Northern pike were detected in the Jefferson River in the 2000s.

The sport fishery of the Jefferson River is primarily comprised of brown and rainbow trout. Current trout density in the upper river is approximately 600 trout per mile in the upper 40 miles of the river, and less than 300 trout per mile in the lower 40 miles of the Jefferson River. Trout abundance is closely associated with streamflow levels, with significant declines in fish populations occurring during drought cycles (late 1980s and 2000-2007), and documented recoveries during recent years of near normal streamflow. The goal of habitat and flow restoration projects in the Jefferson River and associated tributaries is to sustain 1000 trout per mile in the upper 40 miles and 500 trout per mile in the lower 40 miles of the Jefferson River.

Hell's Canyon Creek, Parson's Slough, Willow Springs, North Boulder River are known to be important tributaries for supporting the wild trout population of the Jefferson River. Pipestone Creek, Whitetail Creek, South Boulder River, Antelope Creek, and Willow Creek have significant flow and sediment delivery issues impairing current values for supporting the Jefferson River fishery. Fish Creek, Mill Creek, Halfway Creek, and Whitetail Creek contain conservation populations of Westslope Cutthroat Trout (See draft version of *Status and Conservation Needs for Westslope Cutthroat Trout in Southwest Montana. FWP, 2011*).

Fish stocking records for the Jefferson River are documented to begin in the 1920s and continue through the early 1970s when wild trout management philosophies were instituted. Historically stocked species in the Jefferson River included: rainbow trout, brown trout, cutthroat trout (undesignated), and bass. In 1989 and 1990, rainbow trout and brown trout were stocked for the specific purpose of establishing a spawning run into Jefferson River tributaries. Arctic grayling were stocked in 2002 and 2003; however, no natural reproduction was detected through monitoring, and therefore the reintroduction efforts were terminated.

The Jefferson River is open to angling during the entire year. In the upper portion of the Jefferson River (origin to Williams Bridge FAS) brown trout harvest is limited to three daily and in possession, only 1 over 18 inches, with catch and release only for rainbow trout. These regulations are in place to encourage recovery of fish populations in concert with ongoing habitat conservation activities. Downstream from Williams Bridge FAS, more liberal Central District Standards regulations apply for brown trout with the catch-and-release only regulation maintained for rainbow trout. No limit is imposed on northern pike to help prevent the further establishment of the invading population.

The relationship between drought impacts to trout populations and subsequent angler use are well established for the Jefferson River. Prior to extended drought conditions (initially observed in 1988) angler effort reached 27,456 (1983) angler days. Within the past decade, angler effort in the Jefferson River has varied from 7,000 to nearly 14,000 angler days per year. In other words, during periods of time (years) when flow and temperature conditions are favorable for trout populations, trout densities increase and angler days increase.

Various high mountain lakes and lowland reservoirs exist within the Jefferson River basin. Willow Creek Reservoir, Delmoe Lake, Homestake Lake, Piedmont Pond are coldwater lakes/ponds are stocked annually to provide fishing opportunities.

HABITAT

The mainstem Jefferson River has desirable habitat quality for supporting a sport fishery of brown and rainbow trout during years of average or above average streamflow. Water quantity and quality is severely impaired during drought years when water recedes from structural habitat along the shoreline, and water temperature approaches 80° F. Quality tributaries able to provide suitable trout spawning and rearing habitat are rare.

Over the past 25 years, priority habitat enhancement efforts have focused on flow improvements during summer irrigation, tributary restoration projects to enhance spawning and rearing habitat, and encouraging sound floodplain function practices through permit review processes. Participation in the implementation of the Jefferson River Drought Plan with the Jefferson River Watershed Council and water users has been the primary tool for preventing acute dewatering of the river.

The average width of the river is about 197 feet. The gradient averages 7.3 feet per mile and sinuosity is 1.6. The bottom substrate is primarily gravel-cobble. Heavy depositions of silt occur at some main river sites and in many side channels. FWP determined that the minimum instream flow for fish and other aquatic life for the Jefferson River is 1,100 cfs, based on the upper inflection point of the wetted perimeter (WETP) model.

FISHING ACCESS

Anglers and boaters can launch boats at 11 FASs distributed along the 77 mile reach of the Jefferson River.

SPECIAL MANAGEMENT ISSUES

A drought management plan was developed and approved in July 2000, to attract voluntary participation in meeting stream flow targets in the Jefferson River Basin. This plan was modified in 2012. This plan identifies various flow and temperature targets that once reached initiate conservation measures to benefit the aquatic resources. Considerable work has been completed within the basin to enhance stream flows (e.g., Hell's Canyon Water Lease) and improve spawning conditions (tributary enhancement projects). Future work will look at the potential of flow augmentation from upstream reservoirs (e.g., Ruby and Willow Creek reservoirs) to benefit aquatic resources during times of low flow. Northern pike have become established through an unauthorized introduction in the Missouri headwaters area including parts of the Jefferson River. To address threats of northern pike on trout populations, FWP removed harvest regulations on northern pike throughout the basin in 2011, and initiated removal efforts in 2012.

The Jefferson River drainage is also home to several conservation populations of westslope cutthroat trout providing opportunities to conserve this native species in the drainage. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of non-native species and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of competition and hybridization from non-native species. The long-term goal of cutthroat conservation in the Jefferson is to have 20% of the historically occupied habitat restored to cutthroat trout.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

FISHERIES MANAGEMENT DIRECTIONS FOR JEFFERSON RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Jefferson River and Tributaries (Twin Bridges to Cardwell)	40 miles mainstem	Rainbow trout, Brown trout	Wild	Special Regulations	Continue to restrictive harvest to improve trout numbers to recover from drought impacts
		Mountain whitefish	Wild	General	Continue to maintain abundance
Habitat needs and activities: The upper 40 miles of the Jefferson River and associated tributaries have periodic dewatering issues, but the reach has high potential for trout recovery. Activities: improve instream flow conditions and drought plan implementation, improve spawning tributaries, and maintain function of the river channel and floodplain health.					
Jefferson River and Tributaries (Cardwell to Confluence with Madison River)	40 Miles mainstem	Rainbow trout, Brown trout	Wild	Special Regulations	Continue to restrictive harvest to improve trout recovery
		Mountain whitefish	Wild	General	Continue to maintain abundance
Willow Creek Reservoir	713 acres	Rainbow trout	Wild	General	Continue to manage fish density through angler harvest to maintain fish growth and manage wild brood stock
		Brown trout	Wild	General	Continue to manage fish density through angler harvest to maintain fish growth
Habitat needs and activities: Water Level Management at this DNRC Reservoir					
Delmoe Lake	279 acres	Westslope cutthroat trout	Hatchery	Put- Take	Continue to manage stocking and harvest to maintain fish growth
Habitat needs and activities: Private Reservoir with challenging water level issues. Occasional blue-green algae blooms during late summer.					
Tobacco Root Mountain Lakes	16 lakes and 128 acres	Westslope cutthroat trout	Wild/ Hatchery	General/ Put-Grow-Take	Continue to manage stocking and harvest to maintain fish growth
		Brook trout, Rainbow trout	Wild	General	Continue to manage stocking to maintain fish growth

MADISON RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Madison River originates in Yellowstone National Park at the junction of the Firehole and Gibbon rivers. It then flows in a northerly direction for 149 miles to Three Forks, Montana, where it joins the Jefferson and Gallatin rivers to form the Missouri River. There are two impoundments on the river: Hebgen Reservoir, located 1.5 miles downstream from the park boundary, and Ennis Reservoir, located 65 miles downstream from Hebgen Reservoir. From its source in the park, the Madison crosses a high-forested plateau (7,000 ft and higher in elevation) to Hebgen Reservoir. Upon leaving Hebgen Reservoir, the Madison River flows about 3 miles through a narrow canyon to Earthquake Lake, a natural lake formed by an earth slide during a major earthquake on August 17, 1959. Below Earthquake Lake, the river enters the upper Madison River valley where it flows about 57 miles before entering Ennis Reservoir. After leaving Ennis Reservoir, the Madison enters a narrow gorge (Bear Trap Canyon) where it flows about 14 miles before entering the lower Madison River valley for the final 26 miles to its junction with the Jefferson and Gallatin rivers.

The Madison River is one of Montana's premier wild trout fisheries. High scenic values, good public access and excellent wild trout populations have all contributed to its national reputation as an outstanding sport fishery, and have led to its designation as a "Blue Ribbon" trout stream by MFWP.

Flows in the Madison River are regulated by the two reservoirs. Hebgen Reservoir built in 1915 by the Montana Power Company, stores water for downstream power generation. Water storage usually occurs during the snow runoff period of mid-May through early June. Stored water is released to downstream reservoirs during the fall (October-December). Fall releases usually range from 1,500 to 2,200 cfs at Hebgen Dam. Ennis Reservoir, built in 1908 by a predecessor of the Montana Power Company, has a rather stable water level with little storage capacity of its own. Its primary function is to create a head for the power generating facility immediately below Ennis Dam. Outflows from Ennis Reservoir are mainly regulated at Hebgen Dam. There are a total of 58 lakes or reservoirs in the Madison Drainage, totaling 18,334 surface acres.

Groundwater sources in Yellowstone National Park have a stabilizing influence on the seasonal flow pattern of the Madison River. As a result, the river exhibits a larger base flow in proportion to its annual runoff than most rivers in Montana; thus, the Madison River's seasonal flow pattern more closely resembles that of a giant spring-fed creek rather than a typical snow-fed mountain trout stream.

FISHERIES MANAGEMENT

The Madison River has a variety of native and nonnative fish species. The Madison River historically only had 11 native fish species including Arctic grayling, longnose dace, longnose sucker, Rocky Mountain sculpin, mountain sucker, mountain whitefish, stonecat, white sucker, and westslope cutthroat trout. Several fish species have been introduced including: brook trout, brown trout, common carp, fathead minnow, rainbow trout, Utah chub, and Yellowstone cutthroat trout. The entire river is managed to provide a diverse recreational fishery for both

native and nonnative fish with regulations designed to help protect native populations while promoting harvest on nonnative predatory species that can impact native populations. The entire Madison River is managed as a wild fishery with no normal stocking scheduled for any section of the river.

Rainbow trout, brown trout, arctic grayling, brook trout, and coho salmon were stocked over the past century; however, all fish stocking to supplement wild populations was ended in the early 1970s. The Madison River is the birthplace of Wild Trout Management, where controversial studies conducted in the 1960s and 1970s showed that hatchery rainbow trout had negative impacts on wild-produced rainbow trout. This discovery led to the philosophy of wild trout management throughout Montana's trout rivers, and eventually wild fish management policies throughout all rivers in Montana. Wild trout management also emphasized managing habitat quality to help sustain natural recruitment and healthy fish populations. Hebgen Lake has an extensive history of fish stocking, starting in 1931. Species stocked in the early to mid-1900s included brown trout, undesigntated cutthroat trout, rainbow trout, Yellowstone cutthroat trout. Fish stocking was largely shifted to rainbow trout in the mid 1950s. Ennis Lake stocking was initiated in the late 1920s, and continued through the mid 1990s. Since the 1920s, rainbow trout, Arctic grayling, undesigntated cutthroat trout, and Yellowstone cutthroat trout have been stocked into Ennis Lake.

Regulations on the Madison River are complicated and diverse. Many of the fishing regulations are associated with social issues (e.g., no fishing from boats) and have little biological basis. A large proportion of the river is managed with catch-and-release regulations (with the exception of anglers under 14 years of age), and artificial lures only. Hebgen and Ennis Lakes are managed under Central District Standard regulations with the exception of catch-and-release only regulations for Arctic grayling in Ennis Lake.

Fishing pressure increased more than fivefold since the early 1950's. For the 102 miles of free-flowing river in Montana, angling pressure increased from an estimated 22,660 angler-days in 1952, to 125,726 angler days between May 1983 and April 1984, to over 200,000 angler days in 2009. Nonresident anglers represent upwards of 80% of all angler days in some reaches of the Madison River. Hebgen Reservoir has been a popular fishing destination over the past decade varying from 24,742 angler days in 2007 to 43,134 angler days in 2009. Angler use of Ennis Lake over the past decade has varied from 6,022 angler days in 2005 to 15,844 angler days in 2009.

HABITAT

The Madison River drains approximately 2,500 square miles. About 70 percent of the drainage is covered with coniferous forests. The riparian zone of the wide, open upper and lower Madison River valleys is vegetated with willow, alder, cottonwood and an occasional conifer. Vegetation in the riparian zone of the lower Madison valley is denser than that of the upper valley. Agricultural lands in the upper and lower valley are primarily used for cattle grazing and hay production. The subdivision of agricultural lands along the river in the upper valley for residential development is increasing.

The upper Madison above Ennis Lake generally exhibits excellent water quality and quantity in most years. Stream habitat in the upper drainage is in very good condition. Once the Madison

leaves the canyon below Ennis Lake it begins to suffer from sedimentation and high water temperatures which limit the trout population in the lower river.

There are about 102 tributaries to Montana's portion of the Madison River. Most are short and small. About 20 tributaries provide a significant trout fishery and/or waterfowl habitat. Important tributaries to the Madison include Jack Creek near Ennis and the West Fork in the upper river.

FISHING ACCESS

Fishing Access is well developed throughout the Upper Madison River corridor with 14 FWP-owned Fishing Access Sites, several BLM access sites, and a variety of public land access points. The lower Madison River between Grey Cliff FAS and Milwaukee FAS has little public access, and provides a unique opportunity for floaters to experience a stretch of the river with a low level of use.

SPECIAL MANAGEMENT ISSUES

The Madison River is commonly one of the most fished bodies of water in the State of Montana, with river-wide angler days exceeding 200,000 angler days. Montana Fish, Wildlife and Parks initiated the development of a Recreation Management Plan in 2012 to address social concerns and prevent future degradation of the resource or user experiences. The plan is due to be completed in January of 2013.

The lower Madison River below Ennis Dam suffers from chronic high water temperatures in summer. Fish kills have been documented at water temperatures above 82.5°F. PPL Montana, which operates the two reservoirs on the river, has in place a successful operating plan to keep water temperatures in the lower river below the critical lethal temperature for fish. When model targets dictate, PPL will temporarily raise discharges from Ennis Dam (called pulsing), which holds water temperatures below 80°F at Blacks Ford Fishing Access Site.

In 2010 the last nonnative fish were removed from Cherry Creek, a tributary of the lower Madison River. More than 60 miles of the stream above a high waterfall have been converted to a secure native westslope cutthroat trout refuge. Pure westslope cutthroat trout populations east of the continental divide are rare. The Cherry Creek project substantially increases the limited numbers of this special fish.

The Madison River drainage is also home to several conservation populations of westslope cutthroat trout providing opportunities to conserve this native species in the drainage. Management for non-native trout (brown and rainbow trout) will continue to be emphasized in the mainstem river while opportunities for cutthroat conservation will be pursued in some tributary streams. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of non-native species and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of competition and hybridization from non-native species. The long-term goal of cutthroat conservation in the Madison is to have 20% of the historically occupied habitat restored to cutthroat trout.

FISHERIES MANAGEMENT DIRECTION FOR MADISON RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Madison River and Tributaries - Yellowstone National Park to Elk Creek	97.1 miles mainstem	Rainbow trout, Brown trout	Wild	Special Regulations	Initiate regulation-change process to simplify regulations and allow for harvest opportunities while maintaining fish numbers and sizes.
		Mountain whitefish	Wild	General	Continue to maintain numbers. Research has been initiated to understand population size and trend
Hebgen Lake	12,564 acres	Rainbow trout	Wild/ Hatchery	General/ Put-Grow-Take	Continue to manage stocking and harvest to maintain fish numbers and sizes. Research has been initiated to understand the hatchery contribution to harvest
		Brown Trout, Mountain whitefish	Wild	General	Continue to manage fish density through angler harvest to maintain fish numbers and sizes
Ennis Lake	3,692 acres	Rainbow trout, Brown trout, Mountain whitefish	Wild	General	Continue to manage fish density through angler harvest to maintain fish numbers and sizes
		Arctic grayling	Wild	Conservation	Continue native species conservation to maintain or create viable, genetically unaltered, self-sustaining populations.
Madison River and Tributaries - Elk Creek to Mouth	23.6 miles mainstem	Rainbow trout, Brown trout	Wild	General	Continue to manage fish density through angler harvest to maintain fish numbers and sizes.
		Mountain whitefish	Wild	General	Continue to maintain numbers. Research has been initiated to understand population size and trend
Habitat needs and activities: Investigate approaches to improve spawning and rearing habitat (tributaries), maintain form and function of river channel by preventing degradation from bank stabilization, continue to allow stream access to floodplain, allow natural channel migration, and maintain healthy riparian plant community.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Madison River Tributaries	708.2 miles	Westslope cutthroat trout	Wild	Conservation	Continue native species conservation to maintain or create viable, genetically unaltered, self sustaining populations.
Mountain Lakes	49 lakes and 1,430 acres	Westslope cutthroat trout, Hybridized cutthroat trout, Yellowstone cutthroat trout, Rainbow trout, Brook trout	Wild/ Hatchery	Put-Grow-Take/ General	Continue to manage stocking and harvest to maintain fish numbers and sizes.

GALLATIN RIVER DRAINAGE

PHYSICAL DESCRIPTION

The free-flowing Gallatin River originates at Gallatin Lake in Yellowstone National Park at an elevation of 8,834 ft. It flows north for 115 miles to Three Forks, Montana, where it joins the Madison and Jefferson Rivers to form the Missouri River. From the Park boundary, the river flows about 44 miles through the narrow Gallatin Canyon, and then enters the broad Gallatin Valley, where it flows an additional 45 miles to its mouth. Much of the Gallatin River is classified “Blue Ribbon” by FWP in recognition of its high recreational, fishery, and aesthetic values.

Many factors contribute to the popularity of the Gallatin River with anglers and other recreationists. Much of the river is surrounded by public lands, making it readily accessible to recreationists. The river is also near a rapidly growing population center and is paralleled by a main highway route to Yellowstone National Park. Above all, the natural beauty of the river and surrounding mountains attracts recreationists.

There are 33 natural lakes and reservoirs in the drainage totaling 434 surface acres. Most natural lakes are mountain lakes in the headwaters of the Gallatin River. The largest reservoir in the drainage is Hyalite Reservoir south of Bozeman. Lowland lakes in the valley bottom support urban fisheries which consist of put-and-take rainbow trout and illegally introduced warm water fish of various species. High mountain lake fisheries are either stocked on a regular basis or contain self-supporting populations of westslope cutthroat trout, brook trout, golden trout, or Arctic grayling.

FISHERIES MANAGEMENT

The Gallatin drainage is home to a variety of native fish species including; mountain whitefish, longnose dace, longnose suckers, Rocky Mountain sculpin, mountain sucker, white sucker, and westslope cutthroat trout. Several nonnative fish species are also found in the drainage and include: brown trout, brook trout, rainbow trout and Yellowstone cutthroat trout.

Most streams in the drainage are managed for nonnative self-sustaining wild trout fisheries. These trout populations are currently stable from year to year. Only one pure population of native westslope cutthroat trout exists in the drainage. Hybridized (westslope cutthroat with rainbow trout) populations exist in a few headwaters streams.

Common to many southwestern Montana rivers, fish stocking records for the Gallatin River are documented to begin in the 1920s and extended into the early 1970s when wild trout management philosophies were instituted. The primary fish stocked into the Gallatin River drainage has been rainbow trout; however, undesigned cutthroat trout were stocked between the 1930s and 1950s. Arctic grayling were stocked into the Gallatin River during the mid 1990s and early 2000s in an effort to establish self-sustaining populations. No natural reproduction was detected in the Gallatin River, and restoration efforts were terminated. Hyalite Reservoir is stocked annually with Yellowstone cutthroat trout.

Fishing regulations for streams in the Gallatin drainage are covered under Central District Standard limits and seasons, with three exceptions. These provide that: 1) fishing from boats or vessels from the Yellowstone National Park boundary to the East Gallatin River is not allowed; 2) the river is open to fishing during the entire year; and 3) there is no limit on northern pike to help prevent their establishment.

Angling use on the Gallatin River is high, and over the past decade has varied from 69,254 angler days in 2001 to 93,365 angler days in 2009. During the same time period, angler use of the East Gallatin River has varied from 5,512 angler days in 2007 to 11,679 angler days in 2005, while angler use of Hyalite reservoir has varied from 8,517 angler days in 2001 to 18,511 angler days in 2009. Plowing snow on the Hyalite Reservoir road during winter was recent initiated by the USFS, and this has increased fishing pressure during the winter months.

HABITAT

The Gallatin River drains an area of 11,000 square miles, all above 4,000 ft. Most of the drainage basin above 5,000 ft is covered with coniferous forest, while the basin below 5,000 ft consists primarily of the Gallatin Valley, one of the richest agricultural regions in Montana.

Much of the upper 70 miles of the Gallatin River are surrounded by public lands within Yellowstone National Park and the Gallatin National Forest. This section, except for the uppermost 12 miles, is closely paralleled by US 191, which provides easy access to the river. Dude ranches, lodges and Forest Service campgrounds are scattered throughout the area. The steady rise in recreational and home site development and tourism is expected to have considerable impact on the canyon area in future years.

The lower 45 miles of river flow primarily through private lands within the Gallatin Valley. Access to the lower river is obtained through private lands, state fishing access sites and at bridge crossings. Bozeman, which is seven miles from the river at the closest point of contact, is the largest population center in the drainage.

The narrow canyon reach of the upper Gallatin generally exhibits good water quality and quantity. Stream habitat in the upper drainage is in good condition although the Taylors Fork contributes enough sediment after rain storms to muddy the mainstem Gallatin well downstream. Once the Gallatin leaves the canyon it begins to suffer from dewatering for irrigation and habitat concerns such as bed and bank manipulations. Low water levels, sedimentation, and high water temperature limit the trout population in the lower river. This trend is also found in the East Gallatin River drainage, with generally fish-friendly conditions in the upper tributary streams and conditions worsening in the lower river.

FISHING ACCESS

There are no FWP FASs from the Yellowstone National Park Boundary to the mouth of the Gallatin Canyon; however, public land (mostly federal) and access provided from U.S. Highway 191 provide ample opportunity for anglers to access the Gallatin River within the Canyon Reach. In the lower Gallatin River, eight FWP Fishing Access Sites provide angler access between the Canyon and the confluence with the Madison and Jefferson Rivers near Three Forks. The East Gallatin River has one FWP Fishing Access site.

SPECIAL MANAGEMENT ISSUES

Hyalite Reservoir and other Gallatin River tributaries south of Bozeman Montana provide municipal water for the City of Bozeman. Expansion of the human population in Bozeman and the surrounding area has caused concern over the ability of existing sources (primarily Hyalite Reservoir) to satisfy municipal demand of water. Possible impacts include the development of additional water storage (a new reservoir; potentially in Sourdough Creek) for municipal use.

The Gallatin River drainage is also home to several conservation populations of westslope cutthroat trout providing opportunities to conserve this native species in the drainage. Management for nonnative trout (brown and rainbow trout) will continue to be emphasized in the mainstem river while opportunities for cutthroat conservation will be pursued in some tributary streams. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of nonnative species and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of competition and hybridization from introduced species. The long-term goal of cutthroat conservation in the Gallatin is to have 20% of the historically occupied habitat restored to cutthroat trout.

FISHERIES MANAGEMENT DIRECTION FOR GALLATIN RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Gallatin River and Tributaries (YNP to Shed’s Bridge FAS)	56.1 miles in mainstem	Rainbow trout, Brown trout	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth.
		Mountain whitefish	Wild	General	Continue to maintain population. Initiate research and monitoring to better understand population size and trend
Gallatin River and Tributaries (Shed’s Bridge FAS to Confluence with Missouri River)	32.7 miles in mainstem	Rainbow trout, Brown trout	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth.
		Mountain whitefish	Wild	General	Continue to maintain population. Initiate research and monitoring to better understand population size and trend
Habitat needs and activities: Improve instream-flow conditions, investigate alternatives to improve spawning and rearing habitat (tributaries), maintain form and function of river channel by preventing degradation from bank stabilization, continue to allow stream access to floodplain, allow natural channel migration, and maintain healthy riparian plant community.					
East Gallatin River and Tributaries (Headwaters to Thompson Spring Creek)	25.6 miles in mainstem	Rainbow trout, Brown trout	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth.
		Mountain whitefish	Wild	General	Continue to maintain population. Initiate research and monitoring to better understand population size and trend
East Gallatin River and Tributaries (Thompson Spring Creek to Mouth)	18.6 miles in mainstem	Rainbow trout, Brown trout	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth.
		Mountain whitefish	Wild	General	Continue to maintain population. Initiate research and monitoring to better understand population size and trend
Habitat needs and activities: Improve instream-flow conditions, investigate alternatives to improve spawning and rearing habitat (tributaries), maintain form and function of river channel by preventing degradation from bank stabilization, continue to allow stream access to floodplain, allow natural channel migration, and maintain healthy riparian plant community.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Hyalite Reservoir	158 acres	Yellowstone cutthroat trout	Wild/ Hatchery	Put-Grow-Take	Continue to manage stocking and harvest to maintain present sizes and numbers.
		Arctic grayling	Wild	Special Regulations	Assess possibility for limited and unique harvest opportunity for Arctic grayling.
		Brook trout	Wild	General	Continue to monitor population trends

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

UPPER MISSOURI RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Upper Missouri River drainage includes the Missouri River and tributaries from the confluence of the Jefferson, Madison and Gallatin rivers (near the town of Three Forks), downstream 110 river miles to Holter Dam. The upper river reach extends from the headwaters 43 river miles to the upper end of Canyon Ferry Reservoir. Toston Dam, located 23 miles upstream from Canyon Ferry, is a barrier to upstream fish movement. The dam creates a small, run-of-the-river irrigation storage reservoir that has been retrofitted for hydro-power generation.

Riparian vegetation is limited to a narrow band along the river, except for the lower 10 miles above Canyon Ferry Reservoir where the river channel is braided and the bottomland is extensively vegetated with willows and cottonwoods. Width of the channel varies from 300 to 1,200 feet, the average gradient is 5.6 feet per mile, and the sinuosity is 1.6. Bottom substrate varies from sand-silt to cobble, but the majority is gravel-cobble. Tributaries originate mainly from the east and most are totally diverted during late summer for irrigation. Major tributaries of the Missouri River between Three Forks and Canyon Ferry Reservoir include Sixteenmile, Deep, Dry, Crow, Sixmile, Indian, Greyson and Warm Springs creeks. Many of these tributaries are chronically dewatered during late summer for irrigation. Water to irrigate about 555,400 acres is diverted above this reach. Thus, flow can be severely depleted during the summer irrigation season. Flows in this reach are partially regulated by a number of upstream reservoirs.

The remainder of the mainstem of this drainage is dominated by a reservoir complex that includes three reservoirs: Canyon Ferry, Hauser, and Holter. Canyon Ferry Reservoir is the first major storage impoundment on the Missouri River. Hauser and Holter reservoirs lie about 3 and 30 miles downstream from Canyon Ferry, respectively. Canyon Ferry Dam and Reservoir is operated by the BOR for power production, flood control, irrigation, recreation, and as a municipal water source. At full pool, Canyon Ferry has a surface area of 35,200 acres and a volume of nearly 2 million acre-feet and provides virtually all the storage available in the reservoir complex. Rapid filling of the reservoir begins in early May with peak storage occurring in late June to early July. Major tributaries to the reservoir include Duck Creek, Confederate Gulch, Hellgate Creek, Avalanche Creek, Magpie Creek, and Beaver Creek. The two reservoirs below Canyon Ferry are Hauser and Holter and are operated by PPL Montana. They differ significantly from Canyon Ferry Reservoir in that they are “run-of-the-river” facilities. Hauser Reservoir has a surface area of about 3,800 acres and stores approximately 98,000 acre-feet of water at full pool. The reservoir is about 15.5 miles in length and is relatively narrow, ranging from about 0.1 to 1.1 miles in width. Important tributaries to Hauser Reservoir include Prickly Pear, Silver, Trout, Spokane and McGuire creeks. A biologically important feature of Hauser is Lake Helena, which is a large (surface area of 2,100 acres), shallow water body connected to the Causeway Arm by a narrow channel which was created when Hauser Dam inundated the lower reach of Prickly Pear Creek.

A 4.6-mile reach of the Missouri River is located between Hauser Dam and Holter Reservoir. This unique segment of river flows through a narrow, high-walled gorge for most of its length prior to entering upper Holter Reservoir. Productivity in this river segment is affected by the two upstream reservoirs, which creates tailrace conditions where water temperatures are moderated and the water is enriched with nutrients.

Holter Reservoir has a surface area of about 4,800 acres, stores 243,000 acre-feet of water at full pool and is 25 miles long with widths ranging from 0.1 to 1.1 miles. The 4.6 mile segment of free flowing river located upstream of Holter Reservoir provides very important spawning habitat to migrant salmonids. Beaver Creek, a tributary to this river segment, is the principal spawning stream for reservoir fish, especially in the spring. Cottonwood and Willow creeks are also important tributaries that empty directly into Holter Reservoir.

FISHERIES MANAGEMENT

The Missouri River drainage contains fish species common to southwestern Montana. The native species found here include westslope cutthroat trout, mountain whitefish, mountain sucker, longnose dace, longnose sucker, Rocky Mountain sculpin, stonecat and white sucker. Non-native species are the rainbow trout, brown trout, brook trout, northern pike, yellow perch, walleye and common carp. Hybrids of rainbow trout and westslope cutthroat trout are also found in the drainage.

The Missouri River drainage upstream of Canyon Ferry Reservoir is managed as a wild trout fishery, emphasizing natural reproduction. The basin is also suitable for westslope trout recovery efforts in many locations. Upstream from Toston Dam, the fisheries resources are sparse, due to the poor quality of the river system in terms of temperature and physical habitat. Downstream from Toston Dam was considered a “Blue Ribbon Trout Fishery” into the 1990s. This seasonal fishery was characterized by spawning runs of large rainbow and brown trout from Canyon Ferry Reservoir; however, resident brown trout fishing was also an attraction during this time period. In the 1990s, the expansion of walleye into Canyon Ferry Reservoir modified the composition of the fish community in Canyon Ferry Reservoir, resulting in a significant reduction of spawning trout in the Missouri River downstream from Toston Reservoir. As a result, angling use of this 21-mile stretch of the Missouri River for trout angling has declined substantially.

Over the past decade, angler use of the Missouri River reach downstream from Toston Dam has varied from 2,594 angler days in 2005 to 8,939 angler days in 2009. Upstream from Toston Dam to the Confluence of the Madison and Jefferson rivers, angling pressure over the past decade has varied from 1,564 angler days in 2007 to 3,837 angler days in 2001. The Central Fishing District Standard regulations govern the Missouri River upstream from Canyon Ferry Reservoir. Exceptions include restricted harvest opportunities for brown trout, no limit on northern pike, and size and number exceptions for walleye downstream from Toston Dam.

Common to many southwest Montana rivers, fish stocking records for the Missouri River were documented beginning in the 1920s, and lasting through the early 1970s, when wild trout management philosophies were instituted. Beginning in the late 1920s, rainbow trout, brook

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

trout, brown trout, kokanee salmon, chinook salmon, coho salmon and arctic grayling were stocked. Fish stocking for the purpose of augmenting fisheries ended in the 1950s and 1960s. New sport-fish introductions (salmon species) occurred in early 1970s and conservation stocking projects were initiated in the 1990s and early 2000s to reintroduce brown trout and Arctic grayling, respectively.

Combined, the upper Missouri River reservoir system accounted for 7.7% of the fishing pressure in Montana in 2007. Fishing pressure on these reservoirs is high relative to other bodies of water in Montana. These reservoirs traditionally are in the top 5 most heavily fished waters in Montana, with Canyon Ferry averaging 92,527 angler days (1989-2007), Hauser averaging 58,487 angler days (1989-2007) and Holter averaging 60,657 angler days (1989-2007). This level of pressure equates to an average 15.4 angler days per acre on Hauser, 12.6 days per acre on Holter, and 2.6 angler days per acre on Canyon Ferry. In 2007, Canyon Ferry was the third most heavily fished water in the state, and was the number one flatwater fishery in Montana. Hauser Reservoir was the most heavily fished body of water in the state in 1991. Since 1999 total angler pressure in the reservoir system has declined 31.5%, with Canyon Ferry pressure declining 30.5% and Holter declining 46% between 1999 and 2007. Angler use in Hauser declined through the early 2000's; however, pressure has increased 2.5% from 1999 to 2007. Statewide angling pressure also declined 25.4% over that same time period.

A variety of important fish species are present within the reservoir system. Rainbow trout, kokanee salmon, yellow perch, brown trout, burbot (ling), and walleye are among the species of greatest interest to the public. Downstream movement of hatchery rainbow trout from Canyon Ferry to Hauser and Holter reservoirs has been documented during periods of high surface water releases, and flushing of walleye out of Canyon Ferry has heavily influenced species composition in the downstream reservoirs.

HABITAT

Toston Dam, located 23 miles above Canyon Ferry Reservoir and 6 miles southeast of Toston, is owned and operated by DNRC. It is a small, run-of-the-river irrigation storage reservoir that stores 3,000 acre-feet at full pool and was retrofitted with a 10 megawatt hydro-power generating plant in the 1980's. It has little influence on flows in the Missouri River downstream, but does function as a barrier to upstream migrating fish.

Canyon Ferry Reservoir has a significant impact on the flows of the Missouri downstream to Fort Peck Reservoir. Its typical operation provides benefits to a tailwater trout fishery downstream of Holter Dam, but presents challenges to development and stability of some reservoir fisheries due to fluctuating water levels. Rapid filling of the reservoir begins in early May, with peak storage occurring in late June to early July, followed by a steady decrease of about 2 feet per month during the summer period of high irrigation use (July-September). A decrease in reservoir volume continues throughout the fall and winter in preparation for storage of spring run-off. The retention time of water in the reservoir averages 135 days, but ranges from 50-200 days depending on reservoir elevation and inflow-outflow regimes. The annual water level fluctuation (drawdown) averages about 12 feet. Canyon Ferry Reservoir is typically drawn

down to its minimum level in March, and then is refilled during the March to June period. A reservoir operations steering committee comprised of FWP, PPL Montana, BOR, irrigators, and sportsmen, has developed operational guidelines for Canyon Ferry Reservoir to balance recreational values and minimize impacts to fish and wildlife. This committee meets annually to review operational issues.

Discharge from Canyon Ferry Dam occurs at various outlets: the radial gates near the top of the spillway (30 feet deep); power penstocks (94 feet); the irrigation outlet (110 feet); and the river outlet (147 feet). The power penstocks are usually the main release point, except in spring and summer when additional releases are made from the spillway, irrigation, and river outlets. Releases from the radial gates typically occur during June and July following peak river run-off. Radial gate spills occur in roughly two out of every three years, with an average duration of 30-45 days. Temperature and oxygen content of the release water can vary depending on what outlets are used and the time of year.

Hauser Dam is a straight concrete gravity structure, 700 feet long and 80 feet above the riverbed. The structure consists of an overflow spillway, a non-overflow section, a forebay intake section and two abutment sections. The spillway is 493 feet long with slide gates and removable flashboards for flow control. Hauser Dam has the lowest powerhouse capacity of the three dams (19 megawatts) in the reservoir complex and consequently, spills the most water. Turbine water enters a 32-foot-deep intake channel on the east side of the dam. The six-penstock intakes draw from this channel with the openings from 16 to 30 feet below full pool. Water is spilled from five hydraulic gates and 17 manually operated gates. Water that is spilled is drawn from 0-14 feet below full pool. In a dry year, water may spill as much as 4-5 months of the year, while in a wet water year, water is spilled every day of the year. Water elevations of the reservoir are to fluctuate within a 1 foot elevation, so flows from tributaries and discharge from Canyon Ferry are passed through the facility, and it is operated as a run-of-the-river plant.

Holter Dam is also a straight concrete gravity structure, which is 1,364 feet long and 124 feet above the riverbed. The structure consists of an overflow spillway section, a powerhouse/intake section, a left non-overflow section and a right non-overflow section. It has a usable storage of approximately 81,920 acre-feet. Penstocks are between 24-32 feet below full pool. In addition, an “exciter” unit is always operating, which has a penstock opening from 25-29 feet below full pool. Water is spilled from a depth of 6-16 feet. In very high water conditions, a “cap” can be removed from the spill gates allowing the top six feet of water to be spilled. In a dry year, water may be spilled only one day, while in wet water years, spilling may occur throughout most of the year. Operation of Holter Dam has a significant impact on the fishery, wildlife and recreational resources of the reservoir and downstream as was experienced in 1986 when flows shut down. As part of the FERC re-licensing process, operational guidelines were developed for Holter Reservoir to be operated as a run-of-the-river project with pool elevations maintained within one foot between 3,543 and 3,564 feet msl. Prior to the implementation of the operating guidelines, a steering committee composed of FWP, Montana Power Company, BOR, USFS, irrigators, and sportsmen formulated operational guidelines for Holter Dam to optimize recreational values and to minimize impacts to fish and wildlife. The steering committee recommendations for the

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

operation of Holter Dam include: 1) provide a stable reservoir level, 2) have no large spills (10,000 cfs, total turbine and spill) in August or September; and 3) accomplish facility maintenance drawdowns in March or during September (after Labor Day) through October 15. Adherence to these recommendations and the operating guidelines still serve to protect fisheries habitat today in both the reservoir and the trout fishery immediately downstream.

FISHING ACCESS

The reach on the Missouri River above Canyon Ferry Reservoir has good access for recreationists, and access points are well placed for floaters. These points include the Toston, York's Island and Townsend access sites. In addition, ample opportunities for walk-in access exist within the Canyon Ferry Wildlife Management area.

The reservoir complex has good access for recreationists and access points are well placed for boaters and campers. The BOR, Broadwater County, and private marinas provide access to Canyon Ferry Reservoir throughout its length. The BOR manages recreational areas, including campgrounds, boat ramps, and day-use areas around the reservoir. FWP administers six FASs on Hauser and Lake Helena. The BLM also has two recreation areas that provide access to Hauser and Lake Helena, and three recreation areas that provide access to Holter Lake. **SPECIAL**

MANAGEMENT ISSUES

Unauthorized introductions of predatory species have significantly changed the characteristics of the fishery throughout this drainage. The Upper Missouri River Reservoirs Fisheries Management Plan 2010-2019 guides management within the plan area, which extends from Toston Dam through the reservoir complex down to Holter Dam, including short sections of the Missouri River between Canyon Ferry Reservoir and Toston Dam. In 2012, FWP initiated an environmental assessment to remove northern pike from the entire basin upstream from Holter Dam.

The Upper Missouri River drainage is also home to several conservation populations of westslope cutthroat trout, providing opportunities to conserve this native species in the drainage. The goal of cutthroat conservation work is to secure populations in habitat that is free from the threats of introduced species, and much of this work will be done upstream of natural and man-made fish barriers. A cutthroat trout population is considered secure when it has a minimum population size of 2,500 fish, occupies at least 5-6 miles of stream and is free from the threats of competition and hybridization from non-native species. The long-term goal of cutthroat conservation in the Missouri is to have 20% of the historically occupied habitat restored to cutthroat trout.

MANAGEMENT DIRECTION FOR UPPER MISSOURI RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Missouri River - Confluence of the Madison and Jefferson Rivers to Toston Dam	22 miles	Rainbow trout, Brown trout, Mountain whitefish	Wild	General	Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth.
		Northern pike	Wild	Suppression/ Special Regulations	Continue to allow unlimited harvest to minimize impacts on other sport fishes.
Habitat needs and activities: Continue to improve instream flow, by looking for opportunities to lease water or improve efficiency in irrigational infrastructure and methods.					
Sixteenmile Creek	69 miles	Rainbow trout, Brown trout	Wild	General	Manage as a recreational fishery with larger sized fish available to the angler.
		Brook trout	Wild	General	Manage as a recreational fishery with consumptive harvest.
Habitat needs and activities: Explore potential opportunities to restore habitat on some reaches.					
Missouri River – Toston Dam to Canyon Ferry Reservoir - See Upper Missouri River Reservoir Fisheries Management Plan	21 miles	Rainbow trout	Hatchery	General	Evaluate possible methods to restore migratory fishery in the river.
		Brown trout	Wild	Quality	Manage as a recreational fishery with little harvest.
		Mountain whitefish, Stonecat	Wild	General	Maintain numbers within historic range.
		Northern pike	Wild	Suppression / Special Regulations	Maximize harvest to minimize impacts on other wild & reservoir sport fishes.
		Walleye	Wild	Special Regulations	Adjust regulations as needed to minimize predation.

Westslope Cutthroat Trout Genetically Altered Conservation Population or Mixed Streams	36.1 Miles	Westslope Cutthroat trout & hybrids	Wild/Transfer	Conservation	Maintain or enhance populations. Allow harvest in robust populations.
Brook Trout Streams	624 Miles	Brook trout	Wild	General	Maintain or enhance populations for a recreational fishery for consumptive harvest.

MISSOURI RIVER - DEARBORN DRAINAGE

PHYSICAL DESCRIPTION

The Upper Missouri River drainage includes the Missouri River and tributaries from Holter Dam near Wolf Creek downstream nearly 105 river miles to Morony Dam, 15 miles northeast of Great Falls. This river reach spans nearly 93 miles from Holter to Black Eagle dam. Below Black Eagle Dam, the river is impounded by Rainbow Dam, creating a shallow run-of-the-river reservoir that is available for public fishing. Public access for fishing is not available downstream of Rainbow Dam. Stream gradient averages only about 2 feet/mile and varies from 7.84 feet/mile at Pine Island Rapids to 0.52 feet/mile near Ulm. The river is surrounded by the Big Belt Mountains to the southeast and the east front of the Rocky Mountains to the northwest. Small communities along the river include Craig, Hardy, Cascade and Ulm. The river channel upstream of the Dearborn River has extensive side channel development. It becomes confined and entrenched in a single, deep channel as it flows through a mountainous canyon to the mouth of Sheep Creek. The river then meanders across a wide and flat prairie zone into Great Falls. Riparian vegetation consisting of a willow understory/cottonwood overstory lines much of the lower river.

Major tributaries in this reach include Little Prickly Pear Creek, the Dearborn River, Sheep Creek, the Smith River and the Sun River. Minor tributaries include Rock, Wegner, Stickney, Hardy, Bird, Little Muddy, and Sand Coulee creeks. The tributaries add considerable flow to the Missouri during spring runoff, but contribute little flow during the remainder of the year.

River characteristics and flow in this section are heavily influenced by the three upstream hydroelectric dams, Canyon Ferry, Hauser, and Holter. Canyon Ferry dam is operated by the BOR for irrigation, hydropower, flood control, recreation, and as a supplemental water supply for the City of Helena. Hauser and Holter reservoirs lie downstream from Canyon Ferry and provide hydroelectric power. They are operated by PPL Montana as run-of-the-river projects, passing out the same flows that enter the reservoirs. Water management and storage practices at Canyon Ferry Dam, the largest of the three upstream reservoirs affects flows in this tailwater reach below Holter Dam. Annual mean flow measured below Holter Dam from 1946 to 2011 ranged from 3,008 to 8,497 cubic feet per second (cfs), while annual peak inflows to Canyon Ferry ranged from 3,370 to 34,800 cfs. From 1999 through 2007, a drought in central Montana reduced peak flows in the Missouri River substantially below the long-term average. Annual mean flow measured near Ulm (9 river miles downstream from the confluence of the Smith River) from 1948 to 2011 was 6,247, and ranged from 3,479 to 9,653 cfs; the annual peak flow ranged from 5,300 to 35,000 cfs.

FISHERIES MANAGEMENT

Gamefish species of the greatest interest to the public within this management area include rainbow and brown trout, mountain whitefish, walleye, and burbot (ling). The 35 mile reach from Holter Dam to Cascade Bridge is designated as one of Montana's premier river "Blue Ribbon" trout fisheries. This reach supports an abundance of wild rainbow and brown trout, which are the dominant sport fish; the population includes trophy sized fish.

In most years since 1982, FWP fisheries staff has conducted population monitoring for rainbow and brown trout in two sections of the 35 mile river reach between Holter Dam and the town of Cascade (Craig study section = 5.6 miles, Cascade study section = 4.1 miles). Population estimates are derived using standardized methods, including night electrofishing to mark and recapture fish in the spring and fall. Estimates are based on trout 10 inches and longer.

In fall 2011, rainbow trout in the Craig section were estimated at 6,034 per mile, which is the highest number on record. The 30-year mean is 3,036 rainbow trout per mile. In the Craig section, a numerous 10-12 inch hatchery fish were captured that had flushed from the reservoir complex upstream. Hatchery fish made up 20.2% of the fish sampled, enough to allow for an estimate of 1,605 hatchery rainbow trout fish per mile to be calculated. The presence of this number of hatchery fish in the Craig section is a significant departure from previous sampling efforts. Earlier work had demonstrated little hatchery influence to the trout population below Wolf Creek Bridge. Brown trout greater than 10 inches in the Craig section were estimated at 537 per mile in spring 2011, which is slightly lower than the long term average of 579. In the Cascade section, the estimate of rainbow trout 10 inches or greater was 2,161 per mile. The 30-year mean is 1,506. In the Cascade section, the brown trout estimate was 909 fish 10 inches or greater per mile in spring 2011, much above the long term average of 364.

Additionally, walleye and burbot are incidentally sampled during electrofishing operations. Over the period of record there have been changes in the number of walleye sampled in the Missouri River below Holter Dam. The increase in walleye production in Canyon Ferry Reservoir since 1994 appears to have resulted in an increase in walleye in the Missouri River below Holter Dam. However, no evidence has been gathered which suggests an ecological impact to trout in this reach at the population level. Many factors are present that could negatively affect trout populations, including increased densities of walleye, increase in angler use, prolonged drought conditions, and whirling disease infections. However, despite these factors in play for much of the past 18 years, trout populations appear resilient and show no evidence of decline. The FWP Commission established a “no limit for walleye” harvest regulation on the section of the Missouri River from Holter Dam to Cascade in 2012 as an effort to protect the rainbow and brown trout fishery.

Trout numbers drop markedly below Ulm where burbot and walleye become more prevalent in the fishery. However, trout still remain the dominant game fish. Other common species in this reach of the Missouri River include mountain whitefish, longnose and white suckers, carp, longnose dace, and Rocky Mountain sculpin.

Fishing pressure in the reach is heavy, with the tail water fishery from Holter Dam to Cascade Bridge always ranking among the top 4 fisheries throughout the state during the past 17 years (1991-2007). This section of river has averaged over 91,000 angler days per year since 1991. In 2009, the average annual revenue generated by this 35 mile reach of river was estimated at \$12.1 million. Economic statistics for angler use are based on goods and services anglers purchased during a typical fishing trip, including food, gasoline, bait, lures, license, outfitter-guide fees and lodging. This exercise produces a conservative estimate of the economic value of an angler day because only expenditures for non-durable goods were included and not durable goods such as boats, waders, fishing rods and vehicles.

This section of the Missouri River is popular and heavily utilized for recreation due to both the characteristics of the fishery and the excellent access throughout much of the reach. A frontage road, Old Highway 91, which has officially been designated as a state Recreation Road, parallels much of the river downstream to Cascade. The river section downstream from the Wolf Creek Bridge contains eleven FWP Fishing Access Sites. From Cascade to Morony Dam, there are six more Fishing Access Sites and Giant Springs State Park. A majority (80-90%) of the existing recreational use of this reach of river is angling, but recreational floating has also become more popular seasonally. Other activities include picnicking, camping, trapping, and hunting.

FISHING ACCESS

The reach on the Missouri River below Holter Dam down to Cascade has good access for recreationists and access points are spaced out to provide many options for floaters. Old US Highway 91 parallels the upper reaches of the Missouri River below Holter Dam. There are 14 Fishing Access Sites managed by FWP and one site managed by the Bureau of Land Management; nine of these provide developed or undeveloped boat ramps and four provide access for bank anglers. Between Cascade and Black Eagle Dam, there are four access sites with boat ramps, two managed by FWP and one each managed by the City of Cascade and the City of Great Falls. Additionally, five FWP managed access sites in this reach provide access for bank fishing. Below Black Eagle Dam, a boat ramp provides access for small boats between Black Eagle and Rainbow Dam. FWP also administers two access sites on Little Prickly Pear Creek. Access on the Dearborn River is limited to public land in the headwaters and at bridges on US Highway 287, Highway 200, and Route 435. Also in the upper Dearborn drainage, there is an access site on Bean Lake, but it is currently used exclusively by campers since low water and high total dissolved solids prevent a fishery from being maintained in the lake.

HABITAT

Previous research conducted by the FWP indicated that trout, particularly brown trout, prefer side channels of the Missouri River, rather than the main channel, for spawning. The preference for side channels was apparently related to the presence of more suitable depth, velocity, substrate, and adjacent cover characteristics. These studies further indicated that Missouri River side channels are vital for the rearing of young-of-the-year (YOY) rainbow and brown trout until mid-October, when large numbers of YOY begin moving from the side channels to the main river. Side channels therefore appear to be vital year-round for trout spawning, the incubation of trout eggs, and the rearing of young. Observations indicate that habitat conditions and utilization of the side channels decline precipitously when flows recede below 4,100 cfs. At a flow of 4,100 cfs, 64% of the side channels contained adequate flow for trout spawning, incubation and rearing, while at 3,600 cfs only 9% of the side channels contained adequate flow. Consequently, whenever possible, a year-round minimum flow of 4,100 cfs is recommended to maintain suitable conditions in side channels for trout spawning, incubation and rearing. If water supply conditions do not allow due to drought, PPL managers strive to maintain 2,900 cfs to maintain mainstem riffle habitat.

Housing development along the river banks has resulted in numerous boat ramps, stairs, boat docks, rip rap, retaining walls and vegetation grooming in the upper and lower reaches of this section of the Missouri River. FWP has recommended the Conservation Districts (Lewis and

Clark, Cascade) do not permit new boat ramps in the reach between Holter Dam and Cascade Bridge. Housing development in the lower 26 miles has increased and resulted in FWP making stronger recommendations against bank modifications to preserve river riparian habitat.

SPECIAL MANAGEMENT ISSUES

The Missouri Advisory Committee was established in 1983 when the then operator of Holter and Hauser dams, the Montana Power Company (MPC), was considering returning the operation of Holter Dam to a power peaking facility. It had been operated in that manner prior to the early 1970's. The committee addressed the peaking issue with members representing FWP, MPC (now PPL-Montana), the BOR, outfitters, irrigators, and sporting clubs. The committee continues to meet annually to discuss and coordinate information regarding the fisheries, water supply and weather forecasts, and reservoir operations.

Operation guidelines were integrated into the Federal Energy Regulatory Commission (FERC) order issued as part of the Madison/Missouri River 2188 Project License that included Hauser and Holter dam operations designed to protect the fishery. In addition, PPL-Montana has entered into an MOU with FWP and to cooperate in implementation of the fisheries Protection, Mitigation and Enhancement Technical Advisory Group, which meets annually to discuss potential projects.

The Missouri River Fisheries Management Plan developed in May 1990, which officially guided management direction from 1990 through 1994, provides a partial history of management goals and actions for this reach of the river.

FISHERIES MANAGEMENT DIRECTION FOR THE MISSOURI RIVER- DEARBORN DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Missouri River - Holter Dam to Cascade Bridge	35 miles	Rainbow trout, brown trout	Wild	Special Regulations	Management priority is to maintain trout populations numbers within range observed since 1982 and with a sustainable proportion of larger sized fish available to the angler.
		Mountain whitefish	Wild	General	Maintain population numbers within range observed since 1982. As workload allows, determine limiting factors controlling the population level.
		Walleye	Wild (primarily produced in upstream reservoirs)	Suppression/ Special Regulations	Maintain high harvest to protect wild trout fisheries.
		Burbot	Wild	General	Monitor population through hoop net sampling protocol.
Habitat needs and activities: Cooperate with water management agencies to maintain minimum flows of 4,100 cfs to maintain side channel habitat. During drought, strive to maintain minimum flows of 2,900 cfs to maintain mainstem riffle habitat.					
Little Prickly Pear Creek and tributaries	25.6 miles	Rainbow trout, Brown trout	Wild	General	Maintain resident and Missouri River spawning populations.
Habitat needs and activities: Maintain habitat and instream flows of 70 cfs below Clark Creek and 22 cfs above Clark Creek. Maintain access to stream for fluvial fish.					
Dearborn River and tributaries (South and Middle Forks)	73.3 miles	Rainbow trout	Wild	Special Regulations	Maintain resident and Missouri River spawning populations.
		Mountain whitefish	Wild	General	Maintain population numbers within historic range
Habitat needs and activities: Work with water users to improve instream flow conditions in the drainage. Work with landowners to improve floating safety and maintain fences for livestock.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Missouri River - Cascade Bridge to Black Eagle Dam	57.8 miles	Rainbow trout, Brown trout	Wild	Social/General	Maintain trout populations numbers within historic range with a sustainable proportion of larger sized fish available to the angler.
		Mountain whitefish	Wild	General	Maintain population numbers within historic range. As workload allows, determine limiting factors controlling the population level.
		Walleye	Wild	Special Regulations	Provide high harvest opportunities above the Central District standard daily and possession limits to protect wild trout fisheries.
Habitat needs and activities: Cooperate with water management entities/agencies to maintain minimum flows of 4.100 cfs					
Sheep Creek	2.0 miles	Rainbow trout	Wild	General	Maintain resident and Missouri River spawning populations.
Missouri River – Rainbow Reservoir	200 acres	Rainbow Trout	Hatchery	Put- Take	Manage as a recreational fishery with significant harvest.
		Brown Trout	Wild	General	Manage as a recreational fishery with brown trout as a secondary species.
Private/Public Ponds with public access		Trout warm water species	Hatchery/ Wild	Put- Take	Maintain existing pond fisheries available to the public for harvest
Habitat needs and activities: Enhance structure in ponds when possible.					

SMITH RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Smith River drainage lies in west-central Montana in Meagher and Cascade counties, almost due south of Great Falls between the Big Belt Mountains on the west and the Little Belt and Castle mountains on the east. The drainage is approximately 75 miles in length and the width varies from 3 to 45 miles. The total area is slightly over 2,000 square miles. The elevation of the floor of the drainage varies from 3,350 to 5,400 feet. The highest mountain peaks range from 8,500 to 9,500 feet.

The Smith River is formed by the junction of the North and South forks about 4 miles southwest of the town of White Sulphur Springs. The North Fork drains part of the southwest slopes of the Little Belt Mountains and the northwest slopes of the Castle Mountains. The South Fork originates along the southwest flank of the Castle Mountains and from the bench lands between the Castle and Big Belt mountains. Hot water springs occur in the confluence area between the North and South forks, as well as at the headwaters of the South Fork and serve to elevate water temperatures in reaches of the upper drainage. The mainstem of the Smith River then meanders northwesterly about 41 miles through a broad upper valley before entering a deep mountain canyon near the confluence of Sheep Creek. The river twists north for approximately 45 miles between high limestone cliffs and conifer and grass-covered mountains before flowing another 12 miles through foothill grasslands. After Hound Creek enters the Smith, the river meanders another 24 miles through a relatively narrow, agriculturally developed valley flanked by rolling grasslands until it joins the Missouri River near the town of Ulm about 11 miles west of Great Falls.

In the early 1860s, the discovery of gold in the surrounding mountains stimulated a heavy influx of miners. As gold was depleted and mining operations abandoned, farming and ranching began to take over as the predominant land use in the basin, and they remain so today. Logging and recreation are other important land uses in the drainage.

Approximately 125 tributaries originate in the Big Belt and Little Belt mountains to join the Smith River. Some of the major tributaries originating in the Big Belt Mountains are Birch, Camas, Beaver, Rock, and Hound creeks. Those from the Little Belt Mountains are Newlan, Sheep, Eagle, Tenderfoot and Deep creeks.

Major reservoirs in the Smith River drainage include Newlan Creek and Smith River (Sutherlin) reservoirs. Both are in the Little Belt Mountains. High mountain lakes in the drainage are located in the Big Belt Mountains and include Edith, Grace, Hidden, and Upper Baldy Lakes. Other lakes with fisheries management/recreational importance include Crater and Gipsy lakes. In total there are 15 lakes or reservoirs and 801 surface acres in the drainage.

FISHERIES MANAGEMENT

The Smith River drainage holds about 1,220 miles of perennial streams, including approximately 100 named streams. There are approximately 741 miles of habitat capable of supporting salmonid fishes in the Smith River drainage.

Between 1928 and 1973, approximately 3.5 million introduced trout were stocked in the mainstem Smith River. Tributaries to the river were also stocked with large numbers of introduced trout for many years prior to 1973. The Smith River is a nationally known trout fishery and has been managed as a wild trout fishery since 1974, when the stocking of trout was discontinued.

Brook trout tend to dominate smaller, higher elevation streams, while rainbow trout and brown trout dominate the higher order, lower elevation streams. The majority of extant populations of westslope cutthroat trout in the Smith River drainage reside in high elevation streams on national forest land; six populations of pure westslope cutthroat trout occupy less than 2% of the historic range in the drainage.

Much of the life history of fish and habitat use in the Smith is not well known. Recent telemetry work has shown a high rate use of the Smith River basin by rainbow and brown trout tagged in the Missouri and Sun rivers between Ulm and Great Falls. A basic biological survey defining life history strategies in the mainstem and tributaries along with an inventory of potential habitat problems would provide critical information to enhance and protect the existing fisheries.

In fall 2011, densities of both rainbow and brown trout in the Eagle Creek section of the Smith River were estimated at 250 per mile for each species. The mean for this section, several miles downstream from Camp Baker, based on 33 years of data (1969 to 2011) is 506 rainbow trout and 312 brown trout per mile. The Deep Creek section, also located near the bottom of the canyon reach, has not been sampled in recent years. Trout populations tend to be lower there compared to those upstream in the Eagle Creek section. The mean number of rainbow and brown trout per mile are 168 and 270, respectively, based on 20 years of data gathered from 1970-2006.

The fisheries resource is classified as high value by FWP for the floating section between Camp Baker and the mouth of Hound Creek, where most fishing pressure occurs. An average of 14,129 angler days was expended from the top of the float section to the mouth for the period of record (1982-2009).

Although fish populations appear to be regulated by environmental factors such as winter habitat and low summer streamflows, special regulations were implemented in the float section from Rock Creek to Eden Bridge in 1986. In 2004, the special regulations were extended upstream to include the entire float reach. Harvest through the float section does not appear to be a factor impacting the fishery at the population level. Water-temperature-induced fishing restrictions/closures are a recurring management strategy in drought years. High water temperatures in 2006, 2007 and 2012 caused FWP to implement mandatory time-of-day angling restrictions in mid to late summer and a complete 24 hour per day closure occurred in

2000. The Smith River is also one of 10 streams in Montana where FWP holds a “Murphy” Water Right implemented by the Montana Legislature and periodically calls on this priority water right to maintain instream flows and the aquatic community.

HABITAT

Habitat conditions are variable between the different sections. Stream and riparian habitat have great potential in the upper reaches from the headwaters of the mainstem to the upper end of the canyon (Spring Creek area) where the river meanders mostly through a broad, wide valley in a sinuous pattern. This section of stream almost resembles a large spring creek as it meanders through sedge and hay meadows. Its riparian zone would be dominated by willows and shrubs in a climax condition, and in reaches it contains good instream cover consisting of rooted aquatic vegetation and undercut banks. Other reaches are over-widened with little bank cover, which contributes to algal blooms and high water temperatures. Substrate in this section is primarily sand and gravel. FWP desires to work with willing landowners to improve riparian areas while maintaining existing land uses.

In the canyon section just downstream of Spring Creek to Rattlesnake Boat Camp, the river is incised, and the riparian zone becomes confined between steep limestone walls with limited floodplain development. Riparian vegetation consists primarily of grasses, pine and fir trees, and substrate is gravel and cobble. In some areas, the shrub component has been slowly increasing in recent years.

In the grassland reach below the canyon, the river enters a broad valley of glacial silt, and trout habitat is generally poor. Much of this section is heavily grazed, and riparian vegetation is very limited. Instream habitat is poor due to annual dewatering. Downstream from Eden Bridge, a number of steep erosive banks occur along the stream. Substrate ranges from gravel in the upper end to sand and silt in the lower end, where the gradient decreases and the stream characteristics become more warmwater in nature.

The mean discharge at the USGS gage near Fort Logan (river mile 83.7) was 173 cfs for the period of record (1977-87). The mean annual discharge of the Smith River for a 15-year period that encompass a substantial period of drought at the USGS gage below Eagle Creek (River Mile 79.3) was 244 cfs and ranged from 105-518 cfs. Peak flows ranged from 472 cfs in 2001 to 4,030 cfs in 2011. The mean discharge of the Smith River for a 19-year period of record at the USGS gage near Eden (river mile 27) was 358 cfs. Annual mean flows ranged from 3.1 to 12,300 cfs. Peak flows, based on 27 years of data collection for the Eden gage, varied from 12,300 cfs in 1953 to the lowest of 719 cfs in 1961.

Waters in the Smith River drainage have been appropriated for irrigation, livestock and domestic uses. As in other areas of the state, appropriations are often several times the amount of water actually present. The dewatering and warm irrigation return flows affect the trout fishery of the Smith River. Temperatures above 70°F, which are considered undesirable for trout growth and survival, occur in the river in mid-summer; water temperatures as high as 83°F have been recorded. The low water levels and elevated water temperatures are probably the greatest factor limiting present game fish populations. Enhancing in-stream flows is the key to benefitting the aquatic resources in the Smith River basin. At least two fish kills

involving trout and mountain whitefish have been documented in the South Fork Smith and the mainstem near Eden Bridge; both occurred during periods of elevated water temperatures combined with dewatering of the river. Recurring fish kills involving stonecat have been reported in isolated lower sections of the floating reach over the past decade, generally occurring in late July. Investigations have not determined the cause, but disease or parasites and combined with stress are thought to be likely factors.

FISHING ACCESS

Land ownership in the drainage is about 70% private and 30% public (Forest Service and State). Public access to the river is restricted throughout the drainage on larger streams and rivers. Access across private land is often difficult to obtain, especially in the canyon section. FWP manages four FASs in the in the drainage, including a leased site at Newlan Creek Reservoir, the Fort Logan (aka Smith River) FAS, approximately 19 miles northwest of White Sulphur Springs on the upper river, and Truly Bridge and Lower Smith River on the lower river, 8 and 3 miles south of Ulm. FWP's Parks Division manages two additional fishing access sites as part of the Smith River State Park at Camp Baker (put-in) and Eden Bridge (take-out) to accommodate floaters. As a result of the limited access, a large part of the recreational use of the river involves float fishing and boating on the 61-mile-long section of river from Camp Baker to Eden Bridge. FWP and the USFS maintain numerous boat camps along the floating stretch. The floating season usually begins about mid-May and continues until sometime in July in most years when water levels become too low for floating. FWP manages this popular section of river through a lottery-issued permit system. **SPECIAL**

MANAGEMENT ISSUES

The Smith River Management Act, passed by the Legislature in 1989, delegates to FWP the primary recreational management responsibility for the Smith River waterway between Camp Baker Fishing Access Site and the mouth of the Smith River at the Missouri River. . The FWP Commission has rulemaking authority to regulate recreational and commercial floating and camping use on the Smith River waterway. The Act included a section that provided for part of registration fees to be deposited into the Smith River Corridor Enhancement Account to lease or acquire property in the corridor; develop projects that protect enhance and restore fisheries habitat, streambank stabilization, erosion control, and recreational values; and to maintain and enhance instream flows for recreational and aquatic values in the corridor. The FWP Parks Division administers both the recreation program and the Corridor Enhancement Account.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

FISHERIES MANAGEMENT DIRECTION FOR SMITH RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
North Fork Smith River	42.7 miles	Rainbow trout, Brown trout, Brook trout	Wild	General	Maintain a recreational fishery with harvest within historic population levels.
Habitat needs and activities: Improve instream flows and irrigation water conveyance management. : Maintain habitat and instream flows of 9 cfs					
Smith River (Sutherlin) Reservoir	377 acres	Rainbow trout	Hatchery	Put-Grow-Take	Maintain recreational fishery for consumptive harvest by continued stocking.
		Brook trout	Hatchery	General	Maintain populations and recreational fishery for consumptive harvest by continued stocking if plants exhibit good growth and survival.
		Mountain whitefish	Wild	General	Maintain populations within historic levels.
		Burbot	Wild	General	Maintain populations and recreational fishery for consumptive harvest.
Habitat needs and activities: Work to maintain water levels in reservoir with water users.					
South Fork Smith River	42 miles	Brown trout, Brook trout	Wild	General	Maintain a recreational fishery with harvest within historic population levels.
Habitat needs and activities: Maintain habitat and instream flows of 7 cfs					
Smith River (Confluence of the North & South forks to the Confluence of Sheep Creek)	41 miles	Rainbow trout, Brown trout	Wild	General	Maintain a recreational fishery with harvest within historic population levels.
		Mountain whitefish	Wild	General	Maintain populations within historic levels.
		Burbot	Wild	General	Maintain populations within historic levels providing for consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 90 cfs. Protect Murphy Rights.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Newlan Creek Continued on next page	21.7 miles	Brook trout, Rainbow trout	Wild	General	Maintain a recreational fishery with harvest within historic population levels. Evaluate importance of reach below Reservoir to Smith River fish populations.
Habitat needs and activities: Maintain habitat and instream flows of 3.8 cfs. Consider potential for conveyance of stored water to enhance instream flows in the Smith River. Evaluate potential solutions to reduce impacts from sediment transport from trans-basin diversion ditch.					
Newlan Creek Reservoir	265 acres	Rainbow trout	Hatchery	Put-Grow-Take	Maintain populations and recreational fishery for consumptive harvest by continued stocking. Work to prevent stunting.
		Westslope cutthroat trout	Hatchery	Put-Grow-Take	Maintain populations and recreational fishery for consumptive harvest by continued stocking.
		Brown trout	Hatchery	Put-Grow-Take	Maintain populations and recreational fishery for consumptive harvest by continued stocking if effective
		Brook trout	Hatchery	Put-Grow-Take	Maintain populations and recreational fishery for consumptive harvest by continued stocking if effective
		Burbot	Wild	General	Maintain populations and recreational fishery for consumptive harvest
Habitat needs and activities: Work to maintain water levels in reservoir with water district.					
Big Birch Creek	14.4 miles	Rainbow trout, Brook trout, Brown trout	Wild	General	Maintain populations within historic levels in all reaches which have limited public access potential. Evaluate importance of stream to Smith River fish.
Habitat needs and activities: Maintain habitat and instream flows of 11 cfs.					
Sheep Creek Continued on next page	36.6 miles	Rainbow trout	Wild	General	Maintain populations within historic levels providing for recreational use. Evaluate importance of stream to Smith and Missouri River fish.
		Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

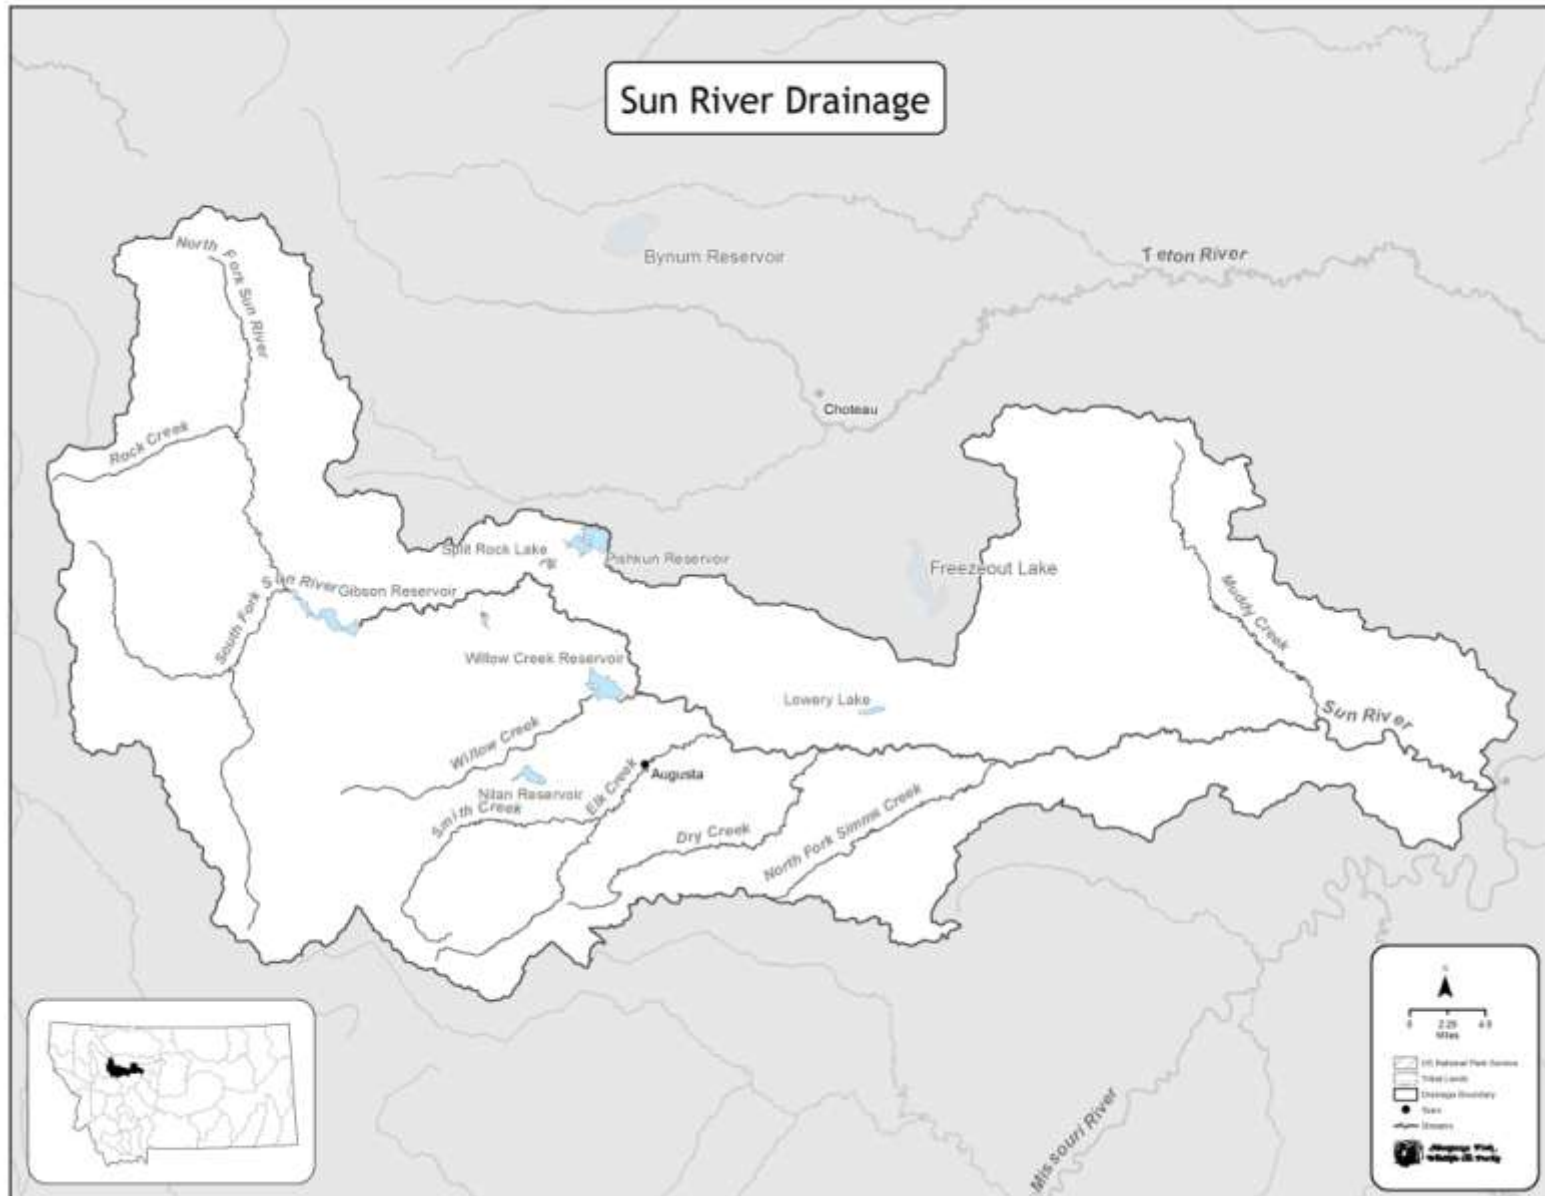

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Mountain whitefish	Wild	General	Maintain populations within historic levels providing for consumptive use. Evaluate importance of stream to Smith River fish.
Habitat needs and activities: Maintain habitat and instream flows of 35 cfs. Maintain water quality and habitat if mining development proceeds in drainage on private land.					
Smith River (confluence of Sheep Creek to the Confluence of Hound Creek)	73.6 miles	Rainbow trout, Brown trout	Wild	Social/Special regulations	Maintain a recreational fishery with minimal harvest within historic population levels.
		Mountain whitefish	Wild	General	Maintain populations within historic levels.
		Burbot	Wild	General	Maintain populations within historic levels.
Habitat needs and activities: Maintain habitat and instream flows of 150 cfs. Protect Murphy Rights.					
Rock Creek	22.8 miles	Rainbow trout, Brown trout	Wild	General	Maintain populations within historic levels providing for recreational use. Evaluate importance of stream to Smith and Missouri River fish.
		Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 11 cfs.					
Tenderfoot Creek	25.9 miles	Rainbow Trout	Wild	General	Maintain populations within historic levels providing for a recreational fishery with some consumptive use. Evaluate importance of stream to Smith and Missouri River fish.
		Westslope cutthroat x Rainbow trout Hybrids	Wild	General	Maintain populations providing for a recreational fishery. Evaluate the potential to provide harvest of hybrids above and below falls.
		Brown trout	Wild	General	Maintain populations within historic levels providing for a recreational fishery with some consumptive use. Evaluate importance of stream to Smith River fish.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
		Mountain whitefish	Wild	General	Maintain populations within historic levels. Determine origin of fish accessing lower reaches of the stream. Identify potential importance or lower reach to Smith River populations.
Habitat needs and activities: Maintain habitat and instream flows of 15 cfs. Support efforts for USFS to purchase Bair Ranch Foundation properties in the drainage.					
Hound Creek	25.2 miles	Rainbow trout	Wild	General	Maintain populations within historic levels providing for a recreational fishery with consumptive use. Evaluate importance of stream to Smith and Missouri River fish.
		Brown trout	Wild	General	Maintain populations within historic levels providing for a recreational fishery with some consumptive use. Evaluate importance of stream to Missouri River fish.
		Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
		Mountain whitefish	Wild	General	Maintain populations within historic levels.
Habitat needs and activities: Maintain habitat and instream flows of 35 cfs.					
Smith River (Confluence of Hound Creek to the Mouth)	24 miles	Rainbow trout, Brown trout	Wild	General	Maintain a recreational fishery with harvest within historic population levels.
		Mountain whitefish	Wild	General	Maintain a recreational fishery with harvest within historic population levels.
		Burbot, Walleye	Wild	General	Maintain a recreational fishery with harvest within historic population levels.
Habitat needs and activities: Maintain habitat and instream flows of 80 cfs.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams(Isolated Single Species Populations)	18.4 miles	Westslope cutthroat trout	Wild	Conservation	Maintain and protect populations to reduce extinction risk. When biologically feasible provide for limited consumptive use.
Habitat needs and activities: Seek opportunities to survey for the presence of WCT and possible restoration projects on private land. Evaluate project(s) to restore WCT populations to Camas Lake and Big Camas Creek.					
Westslope Cutthroat Trout Genetically Altered Conservation Population Streams (Mixed Populations)	28 miles	Westslope cutthroat trout & hybrids	Wild	Conservation	Maintain and protect populations. Allow harvest in robust populations.
High Mountain Lakes in Big Belt Mtns	59 acres (6 lakes)	Westslope cutthroat trout, Rainbow trout	Hatchery/ Wild	Put-Grow-Take/ Quality/ Conservation	Maintain populations for recreational fishery where natural reproduction is limited. Explore opportunities to convert naturally reproducing populations to westslope cutthroat trout populations.
Habitat needs and activities: Explore opportunities to improve spawning potential in some lakes.					

SUN RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Sun River is the second largest tributary of the Missouri River between Canyon Ferry and Fort Peck dams. This west-central mountain stream drains 1,979 square miles of the east slope of the Rocky Mountains. Its headwaters are within the Bob Marshall Wilderness. The upper Sun River basin is situated in steep limestone and shale mountains within the Lewis and Clark National Forest. Its upper tributaries originate at an elevation of about 8,400 feet and converge at Gibson Reservoir located in the Sun River Gorge. Downstream from Gibson Dam, the river flows for only a few miles to the Diversion Dam impoundment, which is located 17 miles northwest of Augusta. Below this dam, the Sun River exits the mountains onto the prairie zone, first through a series of glacial outwash terraces, then till-covered foothills, and, finally, through sedimentary bench lands. The mainstem of the Sun River downstream of Gibson and Diversion dams flows east 97 miles to its confluence with the Missouri River at Great Falls. The Sun River drainage lies within the bounds of Lewis and Clark, Teton, and Cascade counties. The drainage contains about 1,176 miles of perennial streams, of which about 321 are named. Major tributaries include the North and South forks, Willow, Elk, Mill Coulee and Muddy creeks. There are 17 lakes or reservoirs within the drainage, totaling 5,097 surface acres.

The reach of the Sun River between Diversion Dam and Elk Creek is 32 miles in length, and is entrenched in a very narrow valley about 100 yards wide for the first 12 miles, broadening to about 400 yards wide near the lower end of the reach. Riparian vegetation is sparse in the upper third of this reach because of the narrow floodplain. There are only scattered stands of cottonwoods and willows bordering the river with an undergrowth of rose and Russian olive. As the floodplain widens in the lower portion of this reach, deciduous woodland dominated by cottonwoods comprises the riparian zone. The stream gradient in the reach is fairly steep, averaging about 20 feet/mile. A considerable amount of the channel substrate in the upper 12 miles is composed of reefs of bedrock and large boulders. Areas of cobbles and gravel are limited and are usually associated with side drainages or near islands. Since the construction of Gibson and Diversion dams in 1929, very little bedload has entered this reach, thereby preventing development of a more diverse substrate composition. Channel substrates diversify somewhat further downstream, and are composed of boulders and cobbles.

The reach from the mouth of Elk Creek downstream to the Missouri River at Great Falls is 65 miles in length and occupies a wide valley. The riparian zone is cottonwood dominated woodland with rose and willows being the common shrub species found in the understory. The average stream gradient in this lower reach is 9 feet/mile and varies from 17 feet/mile at the upper end to less than 3 feet/mile near the city of Great Falls. The composition of the channel substrate reflects the gradual decrease in stream gradient as well as the geology. Substrate in the upper third of this reach consists mostly of cobbles and gravel with moderate amounts of silt. Further downstream, channel substrate decreases in size and the deposition of silt increases. Below the confluence of Muddy Creek, and for the remaining 17 miles, there is excessive silt deposition. Approximately 80-90% of the sediment load of the Sun River at its mouth originates from Muddy Creek caused by return flows of the Greenfield Irrigation District of BOR's Sun

River Project. The lower two-thirds of this reach is a major recharge area of return flows and surplus diverted irrigation water. Some tributary streams in the lower portion of the drainage transport these return flows and can function as valuable refuges providing cooler water habitat during critical times of the year. Prairie streams entering the drainage from the south harbor a number of native minnow species including the rare northern redbelly x finescale dace hybrid in Adobe Creek.

Land use in the forested upper basin is dominated by wilderness activities, since nearly two-thirds of the upper Sun River basin drains portions of the vast Bob Marshall and Scapegoat wilderness areas. The Forest Service lands outside the wilderness areas are managed for semi-primitive recreation and other uses including livestock grazing, and minor amounts of timber harvesting.

FISHERIES MANAGEMENT

Since 1987, 15 species of fish have been sampled in the Sun River. Rainbow trout, brown trout, and mountain whitefish are generally the most commonly sampled species. Other species regularly sampled include: Rocky Mountain sculpin, longnose dace, longnose suckers, white suckers, and mountain suckers. Infrequently sampled species include: brook trout, common carp, northern pike, burbot, lake chubs, brassy minnow, brook stickleback, spottail shiner, yellow perch, walleye, black bullhead, and stonecats.

Currently, the North and South forks of the Sun River upstream of Gibson Reservoir support popular hybrid westslope cutthroat trout fisheries. Below Diversion Dam, anglers fish for rainbow and brown trout. This fishery tends to be seasonal in nature.

Early sampling events on the Sun River downstream from Diversion Dam did not allow for estimates of population size, only relative abundance through Catch per Unit Effort (CPUE). Comparisons with more recent data show changes in CPUE that are evident for mountain whitefish, rainbow trout, and brown trout in the Augusta and Simms areas. For example, a dramatic drop in CPUE has been observed for brown trout in the Simms area with numbers declining from 29.2 per electrofishing pass in 1987 to 3.4 per pass in 2005. Although the reasons for the differences are unknown, they likely are due to factors associated with irrigation water management, drought, and differences in season when the sampling occurred.

Three long-term fish population monitoring sections were established on the Sun River in 1997 in the Augusta/ U.S. Highway 287 area, the Simms area, and the reach below the town of Sun River. Due to the overall low numbers of trout, rainbow trout and brown trout data were pooled to calculate population estimates. On average, the Augusta/287 section has the highest trout densities. However, the overall trout densities are extremely low in the Sun River when compared to other trout rivers in northcentral Montana. The long-term average trout densities are 116, 43, and 90 rainbow trout and brown trout 8 inches and longer per mile in the Augusta/287, Simms, and Sun River sections, respectively. In comparison, the long-term average density of rainbow trout and brown trout combined in the Smith River are 887 and 429, 8 inches and longer per mile in the Eagle Creek and Deep Creek sections, respectively. Low trout densities are caused by year-round chronic de-watering of the Sun River Basin, resulting from large-scale irrigation withdrawals. This dewatering is especially true in the Simms section area, where the river typically ceases to flow during the summer, and is reduced to a series of disconnected

pools. Despite drought conditions, trout densities have been relatively stable—at the low levels—in all three sections through the period of record.

Nilan, Willow Creek, and Pishkun reservoirs all receive hatchery plants of rainbow trout annually to provide additional fishing opportunities. Pishkun Reservoir is also regularly stocked with kokanee salmon fingerlings. Wild recruitment provides a northern pike/yellow perch fishery in Pishkun Reservoir and a rainbow/rainbow x cutthroat trout hybrid fishery in Gibson Reservoir.

The statewide angling pressure survey for the period 1982-2009 reported that the six major waters in the Sun River drainage averaged 29,619 angler days of use annually. The mainstem Sun River averaged 7,539 angler days, the South Fork averaged 1,135 angler days, and the North Fork averaged 1,491 angler days of use for the period of record. The major reservoirs accounted for 19,454 angler days of use, with Nilan Reservoir averaging 7,832 angler days, 7,083 angler days at Willow Creek Reservoir, and Pishkun Reservoir receiving on average 4,539 angler days.

HABITAT

There are approximately 365 miles of habitat capable of supporting salmonids in the Sun River drainage. Approximately 362 miles of stream support brook trout, and 461 miles support rainbow trout. Diversion Dam was constructed on top of a large barrier waterfall; upstream of this waterfall, the Sun River was historically fishless until fish stocking efforts were initiated in the early 20th century.

Long-term USGS flow records are available for the lower Sun River near Vaughn, which is 14 miles upstream from the mouth. The average annual flow for the 77-year period of record is 672 cfs. Average monthly flows ranged from 254 cfs in January to 2,500 cfs in June. Peak flows at the Vaughn gage averaged 6,754 cfs and ranged from 681-53,500 cfs for the period of Record (1934-2011). Upstream at a USGS gage at Simms, where dewatering is most severe, the mean monthly flows for August and September is 151 and 138 cfs, respectively, for the period of record (1966-2011) compared to 558 and 441 cfs, respectively, at the near Vaughn gage.

Present day flow regimens of the Sun River are largely regulated by Gibson Dam and the associated off-stream storage and irrigation delivery system of the Sun River Project, which includes Pishkun and Willow Creek Reservoirs. This system can accommodate a diversion of nearly 1,700 cfs from the river. Severe dewatering of the river below diversions has commonly occurred in the past. Irrigated agriculture is the largest consumptive use of water in the Sun River basin. Irrigated croplands include hay, alfalfa, and small grains including wheat and malting barley. Irrigation is widespread and intensive throughout the basin. Approximately 120,000 acres of land are irrigated by Sun River waters; 93,220 acres of that are by the BOR Sun River Project. The three major reservoirs in the drainage store about 159,000 acre-feet and supply water to the system throughout the growing season. It has been estimated that it would take about 450,000 acre-feet of controllable flow to meet all of the irrigation needs in the Sun River basin, assuming an overall irrigation efficiency of 40 percent and crops consuming 1.5 acre-feet per acre or a total of about 180,000 acre-feet. This volume of water is not available during many years. For example, although the long-term average for Sun River basin inflows is approximately 592,000 acre-feet, inflows only averaged about 440,000 acre-feet for the period from 2003-2007. During this time, all but 13 percent of the water in the Sun River was diverted at least once for the purpose of irrigation. Most of the 57,000 acre-feet that wasn't diverted was flow during the fall,

winter, and spring runoff that could not be captured and stored or diverted. Of the water diverted for irrigation, approximately 27 percent or about 117,000 acre-feet was consumed, or almost one acre-foot of water consumed per acre of irrigated ground.

FISHING ACCESS

The Sun River is paralleled by a road for its entire course. However, public access to the 97 miles of river is basically limited to seven bridge crossings above Great Falls, three FWP fishing access sites, one BLM developed access site, a carry-in boat ramp near Wadsworth Park in Great Falls, another BLM parcel adjacent to US Highway 287, and state or federally owned parcels in the Alkali Flats area. Above Diversion Dam, the river is surrounded by US Forest Service lands and is an important recreation area with campgrounds.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

FISHERIES MANAGEMENT DIRECTION FOR THE SUN RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
North Fork Sun River	27.1 miles	Rainbow Trout, Rb x CT hybrids	Wild	Special Regulations	Monitor populations to maintain historic population levels.
South Fork Sun River	26.4 miles	Rainbow Trout, Rb x CT hybrids	Wild	Special Regulations	Monitor populations to maintain historic population levels.
Mill Coulee Creek	7.4 miles	Rainbow trout, Brown trout	Wild	General	Maintain populations within historic levels providing for a recreational fishery and consumptive use.
Habitat needs and activities: Improve connection to the Sun River and provide passage for migratory spawning fish.					
Gibson Reservoir	1,289 acres	Arctic grayling	Wild	Conservation/ Special Regulations	Maintain population in upper reaches of the reservoir.
		Rainbow trout Rb x CT hybrids	Wild	General	Maintain populations providing for a recreational fishery and consumptive use taking into account the significant water elevation changes in the reservoir.
Sun River – Diversion Dam to mouth of Elk Creek	32 miles	Rainbow trout, Brown trout, Mountain whitefish	Wild	General	Maintain a recreational fishery and enhance population levels of all species compared to historic numbers.
		Burbot	Wild	General	Enhance population numbers.
Habitat needs and activities: Improve instream flows and irrigation water and conveyance management to improve chronic dewatering. Maintain habitat and instream flows of 100 cfs. Excellent potential to improve the fishery.					
Sun River Slope Canal	34.4 miles	Arctic grayling	Wild	Conservation	Maintain viable population in the canal.
Habitat needs and activities: Maintain overwinter habitat in upper reaches of the canal at drops to preserve population. Salvage fish at lower drops that are lost to the population and would perish if not transferred to other upstream waters.					
Sun River – Mouth of Elk Creek to confluence with Missouri River Continued on next page	65 miles	Rainbow trout, Brown trout, Mountain whitefish	Wild	General	Maintain a recreational fishery and enhance population levels of all species compared to historic numbers.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

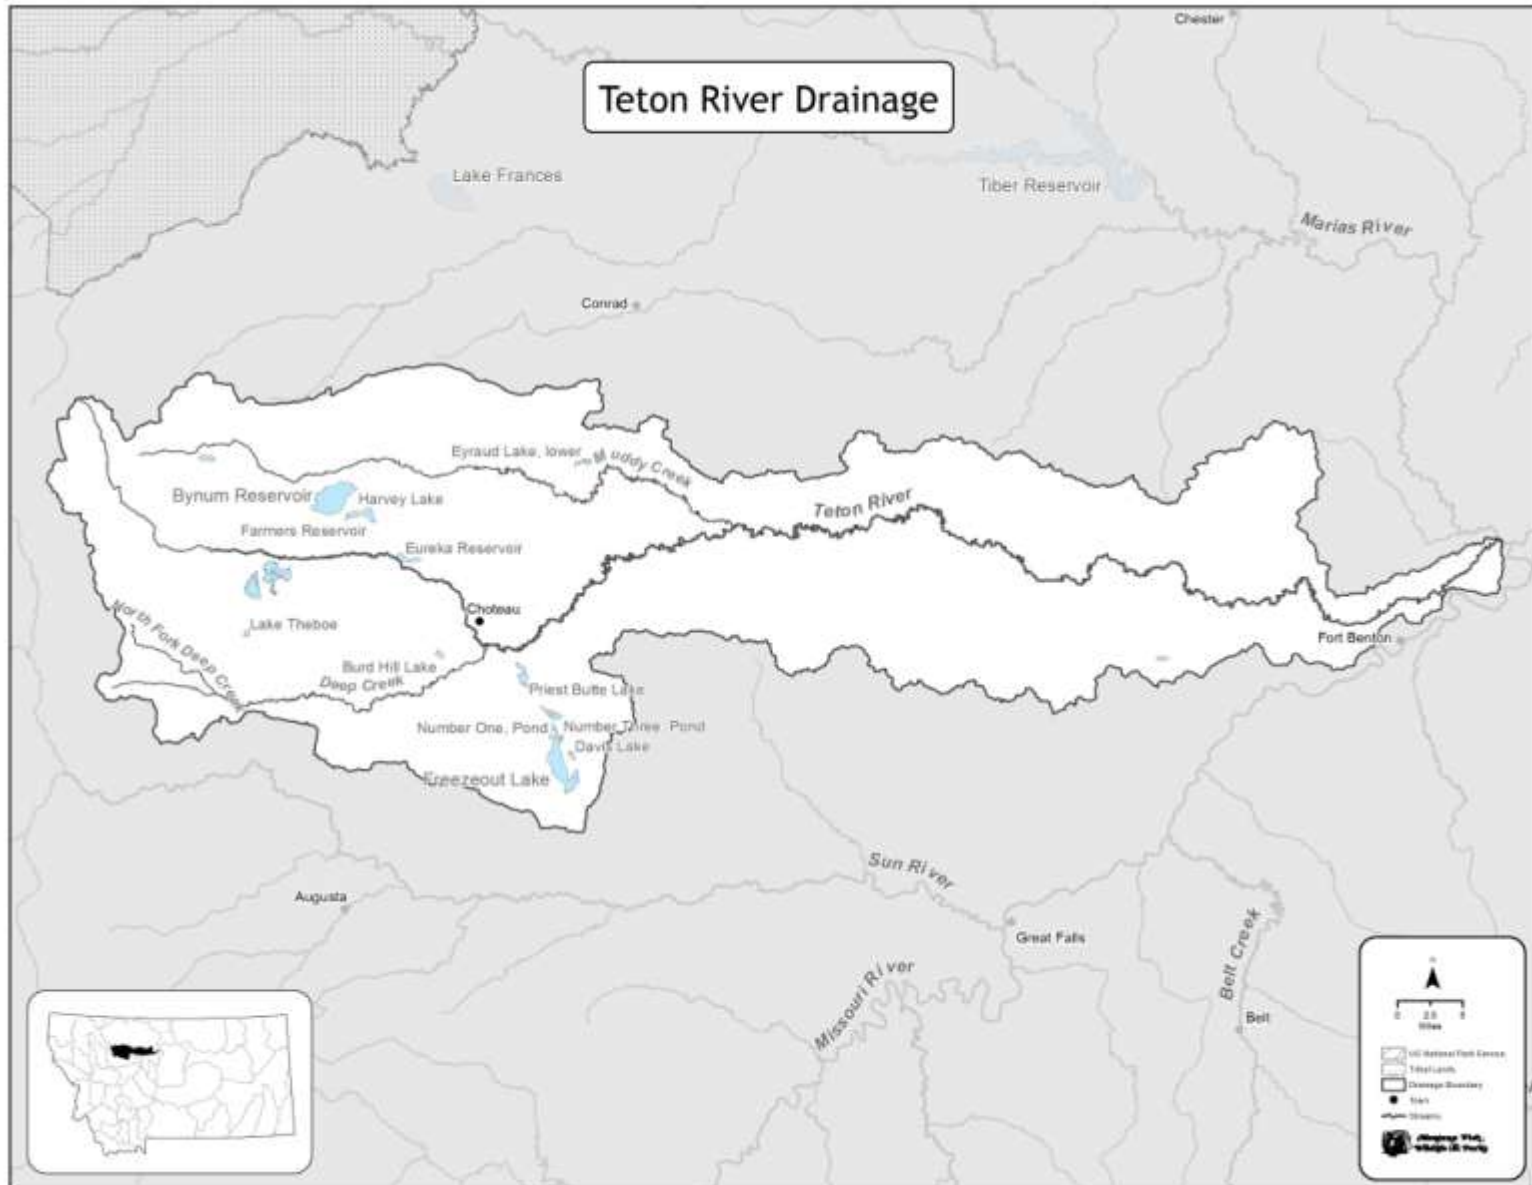

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Burbot	Wild	General	Enhance population numbers.
		Stonecat	Wild	General	Maintain and enhance existing population levels.
		Northern pike	Wild	General	Maintain minimum population levels.
		Walleye	Wild	General	Manage short reach inhabited in conjunction with Missouri River.
		Native minnow species	Wild	Conservation	Safeguard species of special concern to maintain population levels.
Habitat needs and activities: Improve instream flows and irrigation water conveyance management to improve chronic dewatering and irrigation based erosion. Maintain habitat and instream flows of 130 cfs . Excellent potential to improve the fishery.					
Willow Creek	28 miles	Brook trout	Wild	General	Maintain populations within historic levels providing for a recreational fishery and consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 3 cfs.					
Ford Creek	19.3 miles	Brook trout	Wild	General	Maintain populations within historic levels providing for a recreational fishery and consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 12 cfs.					
Elk Creek	32.5 miles	Rainbow trout, Brown trout, Brook trout	Wild	General	Maintain populations within historic levels providing for a recreational fishery and consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 16 cfs. Improve water management to reduce chronic dewatering. Work to maintain passage from Sun River for adfluvial spawning migrations.					
Pishkun Reservoir	1,518 acres	Rainbow Trout	Hatchery	Put-Grow-Take	Maintain recreational fishery for consumptive harvest by continued stocking.
		Kokanee salmon	Hatchery	Put-Grow-Take/ Special Regulations	Maintain recreational fishery for consumptive harvest by continued stocking.
		Yellow perch	Wild	General	Maintain recreational fishery for consumptive harvest.
		Northern pike	Wild	General	Manage size and population by recommending manipulation of water levels during spawning.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Habitat needs and activities: Request cooperation of Irrigation District to manage water elevations to control northern pike spawning success.					
Willow Creek Reservoir	1,314 acres	Rainbow trout	Hatchery	Put-Grow-Take	Maintain recreational fishery for consumptive harvest by continued stocking.
Nilan Reservoir	521 acres	Rainbow trout	Hatchery	Put-Grow-Take	Maintain recreational fishery for consumptive harvest by continued stocking.
		Brown trout	Wild	General	Maintain recreational fishery with limited consumptive harvest.
Tunnel Lake	14 acres	Westslope cutthroat trout	Hatchery	Put-Grow-Take	Maintain recreational fishery for consumptive harvest by continued stocking.
		Arctic grayling	Transfer/ Wild	General	Maintain recreational fishery with limited consumptive harvest.
Wood Lake	20 acres	Westslope cutthroat trout	Hatchery	Put-Grow-Take	Maintain recreational fishery for consumptive harvest by continued stocking.
Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams (Isolated Single Species Populations)(2 Streams)	5.0 miles	Westslope cutthroat trout	Transfer/ Wild	Conservation	Maintain and protect populations to reduce extinction risk.
Habitat needs and activities: Maintain or improve habitat. Explore opportunities to expand existing reaches for populations. Investigate potential to establish additional pure populations above barriers and potential barrier sites.					
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Westslope Cutthroat Trout Genetically Altered Streams (7 streams)	24 miles	Westslope cutthroat trout, Rb x WCT hybrids	Wild	Conservation	Maintain and protect populations of genetically tested 90-99% WCT.
Habitat needs and activities: Maintain or improve habitat.					

TETON RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Teton River Basin is located in Teton and Chouteau counties of Northcentral Montana. The headwaters originate along the east front of the Rocky Mountains, flow approximately 175 miles in an easterly direction, and enter the Marias River at Loma. The drainage contains about 734 miles of perennial streams and approximately 68 named perennial streams. There are 14 lakes or reservoirs in the drainage for a total of 7356 surface acres. Yearly precipitation averages 12-14 inches, with higher amounts occurring near and in the mountains. The mainstem Teton River originates with the junction of its North and South forks approximately 22 air miles northwest of Choteau. It flows generally eastward to Choteau along gently rolling hills and flat terrain. Principal tributaries include Deep Creek, McDonald Creek, Spring Creek and Muddy Creek. Stream substrate is characterized by glacial materials with abundant gravel, cobble and boulders. Due to the gravelly conditions, channel movement is quite active with channel braiding occurring in some areas. Stream gradient is about 35 feet/mile. Water clarity is good but becomes turbid with sudden increases in flow. The coldwater reach is approximately 33 miles in length, extending down to the discharge from Priest Butte Lake.

The riparian area consists of willows and cottonwoods throughout most of the reach, with limber pine and aspen near the headwaters. Floods in 1964 and 1975 destroyed most of the stream bank vegetation. Much of this vegetation has recovered in some areas.

Choteau is the largest town within the basin, having a population of about 1,600. Smaller communities include Dutton, Bynum, Pendroy, Agawam, Farmington and Collins. The major land uses are for crops and livestock. Approximately 80,000 acres are irrigated in the basin by many private individuals and four local ditch companies. Off -stream storage is held in Bynum, Eureka and Farmers reservoirs, and Eyraud Lakes.

Approximately 15% of the basin is national forest. Considerable exploration for oil and gas has occurred, with several shallow wells presently producing oil in the northern part of the basin. Although coal deposits are present, no commercial mining has taken place. Oil and gas exploration and potential future development continues to be a possibility. In the 33-mile reach from the headwaters to the discharge from Priest Butte Lake near Choteau, land uses include grazing and hay land with some grain crops along the lower portions. Landownership within this stream reach is approximately 80% private and 20% state. Stream access is controlled by private landowners, but is usually granted upon request. The Teton River is crossed by two highway bridges near Choteau, seven county road bridges and several private bridges and fords.

FISHERIES MANAGEMENT

The Teton River Basin provides a trout fishery for people in the local area. There are approximately 329 miles of stream in the Teton River drainage that support brook trout and 194 miles that support rainbow trout. Small populations of pure westslope cutthroat trout are found in headwater streams, which occupy less than 2% of the historic range in the drainage. While rainbow, brook and brown trout and mountain whitefish occur in the middle to upper reaches of the river and tributaries, sauger, burbot, channel catfish, shovelnose sturgeon, and northern pike

are found in the lower Teton River when water is present. Reservoir fisheries, which include Bynum, Eureka, and Eyraud, are composed of rainbow trout and northern pike/yellow perch or trout/yellow perch.

There are several diversions on the upper Teton River above Choteau that divert small amounts of water, three diversions that can divert about 200 cfs, and one large diversion capable of withdrawing 1,000 cfs during flood conditions. Portions of this stretch are subject to low flows or complete dewatering by irrigation diversions. The portion of the reach above Choteau has mostly small brook trout and fewer numbers of brown trout, rainbow trout and mountain whitefish. The lower portions of the reach below Choteau experience very low, but more stable flows due to groundwater recharge entering the stream. The fishery is composed of brown trout, mountain whitefish and rainbow trout. Fish present other than trout include blue, longnose, white, mountain, and shorthead redhorse suckers, longnose dace, Rocky Mountain Rocky Mountain sculpin, lake chub, carp, brook stickleback and goldeye.

HABITAT

USGS flow records at the Teton River below the South Fork gage show mean monthly flows of 214 and 82 cfs for the critical months of August and September for the period of record, respectively. USGS discharge records for the lower end of the near Priest Butte Lake are available from June, 1913 to June, 1919. Maximum discharge was 4,500 cfs on June 22, 1916, and a minimum of 1 cfs occurred between August 9 and August 16, 1916. The low readings are influenced by the many diversions above the recording station. Further downstream at the USGS gage near Dutton, the mean monthly flows drop to of 66 and 59 cfs for the months of August and September, respectively. Near the mouth of the Teton River, the mean monthly flows for the period (1998-2011) of record drop precipitously to 12 and 7.4 cfs for August and September, respectively. In fact, at this lowest gage the mean monthly flows have been 0 cfs (dry riverbed) for 50% and 43% of the months of August and September, respectively, during the period of record.

The dewatering of tributary streams and large reaches of the Teton River for irrigation is the greatest problem facing the maintenance of aquatic and fisheries resources in the Teton River basin. Adjudication of water rights in the basin implementing a final decree that recognizes downstream water rights and the work of a water commissioner to administer those rights, has the greatest potential to provide aquatic habitat now absent in the Teton drainage.

FISHING ACCESS

Public access is available throughout the public land in the headwaters area. Downstream, throughout the drainage, there are no public access sites on the Teton River; fisheries resources and habitat (i.e., flows) need to be addressed before it would be warranted to seek improved fishing access. Public access to private lands has usually been allowed with permission. The only FWP access sites are those associated with reservoirs at Bynum Reservoir, Eureka Reservoir, and Upper Eyraud Lake.

SPECIAL MANAGEMENT ISSUES

Water rights adjudication in the basin and enforcement of a decree will play a critical role in the future of large reaches of the mainstem and tributaries and whether they remain chronically dewatered or once again become perennial streams.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

FISHERIES MANAGEMENT DIRECTION FOR THE TETON RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Teton River - Headwaters to the Discharge from Priest Butte Lake	33 miles	Brook trout, Brown trout, Rainbow trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
		Mountain whitefish	Wild	General	Maintain populations within historic levels .
Habitat needs and activities: Maintain habitat and develop instream flows of 35 cfs. Explore strategies to prevent chronic dewatering of the mainstem of the Teton River upstream of Choteau.					
McDonald Creek	8 miles	Brook trout Brown trout Rainbow trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 10 cfs. Explore strategies to prevent chronic dewatering.					
South Fork Deep Creek	8.8 miles	Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
		Westslope cutthroat trout Rainbow trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
		Westslope cutthroat trout	Wild	Conservation	Maintain and protect populations to reduce extinction risk.
Habitat needs and activities: Maintain habitat and instream flows of 6.9 cfs. Evaluate potential for greater access.					
North Fork Deep Creek	4 miles	Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 7.2 cfs. Explore strategies to prevent chronic dewatering.					
Deep Creek	38 miles	Rainbow trout, Brown trout, Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 18 cfs. Explore strategies to prevent chronic dewatering.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Spring Creek	13.1 miles	Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
		Rainbow trout	Hatchery/Wild	General	Maintain populations within historic levels providing for consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 4.5 cfs. Evaluate strategies to prevent chronic dewatering.					
Bynum Reservoir	3,205 acres	Rainbow trout	Hatchery	Put-Grow-Take	Maintain opportunity for catching larger sized fish.
		Kokanee	Hatchery	Put-Grow-Take	Manage as a consumptive fishery.
		Yellow perch	Wild	Family Fishing Water	Provide an opportunity for a fishery not available in other waters in Region 4. Restrict fishing contests incompatible with Family Fishing Water management goals.
		Walleye	Hatchery/Wild	Put-Grow-Take/ General	Evaluate reestablishing a walleye fishery if productivity of existing fisheries decline.
Habitat needs and activities: Maintain a fishery with whatever water levels irrigators maintain in the reservoir.					
Eureka Reservoir	366 acres	Rainbow trout	Hatchery	Put-Grow-Take	Manage as a recreational fishery with consumptive harvest.
Habitat needs and activities: Evaluate benefits to anglers of both fish plants and FAS lease under current water level management in the reservoir.					
Teton River - Discharge from Priest Butte Lake to Mouth	151 miles	Blue sucker	Wild	Conservation	Maintain populations within historic levels.
		Channel catfish	Wild	General	Manage as a consumptive fishery.
		Shovelnose sturgeon	Wild	General	Reestablish a recreational fishery with consumptive harvest.
		Stonecat	Wild	Conservation	Reestablish a native species fishery.
		Sauger	Wild	Conservation	Reestablish a native species fishery with some consumptive harvest.
		Northern pike	Wild	General	Manage as a consumptive fishery.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Habitat needs and activities: Develop methods to prevent total dewatering of the Lower Teton River.					
Eyraud Lakes	223 acres	Northern pike, Yellow perch, Largemouth bass	Wild	General	Maintain populations within historic levels for a recreational fishery with consumptive harvest.
Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams (3 streams)	5.5 miles	Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk.
Habitat needs and activities: Replicate populations to protect them from extinction.					
Westslope Cutthroat Trout Genetically Altered Streams (7 streams)	22.5 miles	Westslope cutthroat trout & hybrids	Wild	Conservation	Maintain or enhance populations. Allow harvest in robust populations.
Habitat needs and activities: Evaluate potential sites for a major barrier on North Fork Teton River.					

BELT CREEK DRAINAGE

PHYSICAL DESCRIPTION

Belt Creek is a major tributary of the Missouri River. It originates on the northwest side of the Little Belt Mountains and flows in a northerly direction for about 88 miles to its confluence with the Missouri, 14 miles downstream of Great Falls in Cascade County. Belt Creek drains approximately 800 square miles of the Little Belt and Highwood mountains. The basin contains approximately 186 named perennial streams, comprising a total length of about 442 miles of perennial stream habitat. Major tributaries to Belt Creek include Jefferson, Dry Fork, Tillinghast, Pilgrim, Logging, Big Otter, Little Belt and Big Willow creeks.

The upper basin of Belt Creek is situated in the mountainous area of the Lewis and Clark National Forest with its headwaters at an elevation of about 8,000 feet. The landscape of the headwaters is comprised of plateau-like mountains with V-shaped valleys carved through the sedimentary Belt formation of the parent rock. The basin supports subalpine and montane forests consisting mostly of lodgepole pine, Douglas fir, ponderosa pine, and subalpine fir. Within these forest zones, the upper 33 miles of Belt Creek flows through a steep, narrow valley before entering the Sluice Boxes, a limestone gorge about 14 miles in length. The riparian vegetation of the floodplain is variable with respect to elevation, consisting of an overstory of spruce and lodgepole pine in the cool, higher areas and lodgepole pine, Douglas fir, ponderosa pine and cottonwood in the lower temperate zone. Willows, water birch, rose, and red osier dogwood are shrub species which dominate the undergrowth of the riparian. There are very few meadow areas along Belt Creek.

The gradient for this size of stream is unusually steep, averaging about 90 feet/mile near its headwaters at Neihart, to 40 feet/mile at the lower end near Monarch. Channel substrates reflect the cascading nature of Belt Creek with boulders, large cobbles, and several outcroppings of bedrock typifying the stream bottom.

Belt Creek at the lower elevations flows through prairie foothills and benchlands joining the Missouri River at an elevation of 2,800 feet. This lower section begins at the confluence with Big Otter Creek and flows for 39 miles through gently dipping sandstone and shale formations while remaining entrenched within a narrow valley. The upper 13 miles of this reach typically are intermittent during dry periods, probably losing water to cavernous limestone. Downstream of this point, the stream typically becomes effluent again and remains perennial throughout its remaining course. The riparian vegetation consists of a diverse woodland environment dominated by a cottonwood overstory with an undergrowth of willows, chokecherry, rose and snowberry. Although the stream gradient lessens from that of upper Belt Creek, the average gradient of 28 feet/mile is unusually steep for a large prairie stream. Channel substrate is comprised primarily of cobbles, although scattered boulders are still present throughout its length. Cobbles and gravel in the lower end show increased silt deposits due to heavy sediment loads entering from lowland tributaries.

Land use in the Belt Creek drainage includes most types found east of the Divide. Timber harvest has been extensive in the past; however, harvest has been substantially reduced. Mountain pine beetle infestations and spruce budworm has had significant impacts on the forest health in recent years. Nearly all of the land within the lower basin is managed for cattle ranching or farming. A substantial amount of livestock grazing occurs in this area. Only minor grazing occurs in the forested upper basin. Hay and some crop land exist along the stream, but little of it is irrigated. There has been extensive silver, lead, zinc and gold mining in the Little Belt Mountains in both the Carpenter-Snow Creek and Barker-Hughesville Mining districts. Along with the mining of various ore deposits, serious heavy metals pollution has occurred from several abandoned mining tailings. The water quality of streams in the Belt Creek drainage has been impaired as a result of runoff and groundwater. Both mining district sites are Federal Superfund sites and are in the early stages of remediation work.

A USGS stream flow gage on Belt Creek near Monarch (river mile 52.0) recorded an average annual flow of 192 cfs for the 31-year period of record from 1951-82. A relationship was also developed to predict flows on Belt Creek at the Riceville Bridge at the lower end of Sluice Boxes State Park based on flows at the USGS Smith River below Eagle Creek Gage.

FISHERIES MANAGEMENT

From the headwaters to the mouth of Big Otter Creek, a reach of approximately 51 miles, rainbow trout are the predominant sport fish found throughout the lower elevation, higher order stream reaches followed by mountain whitefish and brown trout. Westslope cutthroat (WCT) and brook trout are uncommon in the lower mainstem, but good populations are present in some tributary streams and the headwaters area. Brook trout tend to dominate the smaller, higher elevation streams. There are approximately 211 miles of stream that support rainbow trout and 197 miles of stream that support brook trout in the Belt Creek Drainage. Approximately 37 miles of stream in the Belt Creek Drainage support pure WCT. Due to this relatively large number of headwater streams that hold conservation populations of WCT, the upper portion of the mainstem Belt Creek has good numbers WCT of varying purity. This abundance of WCT populations is primarily an artifact of the presence of naturally formed waterfalls and fragmented habitat in the Belt Drainage. Non-game species in the upper reaches of the drainage include mountain, white and longnose suckers, longnose dace, and Rocky Mountain sculpin.

The statewide fishing pressure and harvest survey for the period 1982-2009 reported an average of about 7,500 angler-days of use annually and ranged from 3,437 in 2001 to 13,424 angler-days in 1997. The most recent data estimated that 10,330 angler-days occurred on Belt Creek in 2009.

Because of substantial fishing pressure and problems with dewatering in the lower portion of this reach, the lower 13 miles does not maintain an adequate self-sustaining trout population. Approximately 3,000 catchable rainbow trout were historically stocked in this section annually from the early 1960's to 1996. Tributaries to Belt Creek were also stocked with large numbers of non native trout for many years prior to 1996.

This lower reach of Belt Creek between the mouth of Big Otter Creek and the confluence with the Missouri River (39 miles), supports both coldwater and warmwater fisheries. A marginal

resident trout fishery exists in this reach and is limited because of low stream flows, high water temperatures, excessive siltation, and in some areas from acid mine drainage effluent from old coal mines. Rainbow trout are the most common trout species found. Brown trout occur throughout the reach, but in far fewer numbers. To some extent both rainbow and brown trout from the Missouri River migrate up Belt Creek during their spawning season. Mountain whitefish have also been observed to migrate in large numbers into the lower mile of Belt Creek from the Missouri River to spawn. Historically, sauger migrated up Belt Creek (as high as Arrington) during the late spring and resided in the stream until fall as long as flow conditions were adequate. No sauger have been observed in recent years in Belt Creek. However, credible reports of shovelnose sturgeon at Salem Bridge have been reported in recent years. In 1997 high flows in the Missouri River resulted in confirmed reports of northern pike in the sluice boxes section. Non-game fish found in lower Belt Creek include goldeye, longnose, mountain and white suckers, shorthead redhorse, carp and Rocky Mountain sculpin.

FISHING ACCESS

The Belt Creek drainage has a high scenic value. It is a popular recreation area for fishing, hunting, picnicking, camping, hiking, mountain biking, motorized trail riding, and for the adventurous, floating. U.S. Highway 89 parallels Belt Creek throughout the upper section and provides access to most portions of the stream. Much of upper Belt Creek and its tributaries receive a substantial amount of fishing pressure due to its proximity to Great Falls, the convenient access provided by Highway 89 and the availability of numerous developed and dispersed camping sites. A winter sports area is located in the upper basin, providing additional easy access to the stream. The only FWP land on Belt Creek that provides angler access is Sluice Boxes State Park. Routes 331 and 228 parallel the stream for about 25 miles of the lower section. Public access to private lands bordering lower Belt Creek has usually been allowed with permission. The remaining 14 miles of this lower portion flows through remote and rugged lands and access is difficult except at the Salem Bridge, about a mile upstream from the mouth.

SPECIAL MANAGEMENT ISSUES

Nineteen populations of genetically pure WCT currently occupy less than 15% (33 miles) of the total historic range in the drainage. Four of the populations are at a moderate risk of extinction over the short term. These represent priorities where short and long term actions are required to reduce extinction risk and provide increased protection or expansion of the populations.

FISHERIES MANAGEMENT DIRECTION FOR BELT CREEK DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Belt Creek (Headwaters to the Mouth of Big Otter Creek)	51 miles	Rainbow trout, Brown trout, Brook trout	Wild	General	Maintain populations within historic levels providing for consumptive use.
		Mountain whitefish	Wild	General	Maintain numbers within historic range.
		Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations. Expansion downstream of existing occupied area would require a large barrier project on the mainstem Belt Creek. Survey tributaries and upper reaches of mainstem to determine upstream limit of WCT. When biologically feasible, provide for limited consumptive use.
Habitat needs and activities: Maintain habitat and instream flows of 90 cfs.					
Big Otter Creek	26.5 miles	Brown trout	Wild	General	Manage as a recreational fishery with the opportunity to catch large brown trout.
		Brook trout, Rainbow trout	Wild	General	Manage as a recreational fishery with some consumptive harvest.
Habitat needs and activities: Maintain spring creek type habitat and instream flows of 5 cfs.					
Logging Creek	11 miles	Brook trout, Rainbow trout, Brown trout	Wild	General	Manage as recreational fishery with consumptive harvest.
		Westslope cutthroat trout	Wild	Conservation	Monitor the conservation population in the headwaters.
Pilgrim Creek	7.5 miles	Westslope cutthroat trout	Wild	Conservation	Collect additional genetic samples and determine if headwater populations remain non-hybridized. Enhance existing barrier near the mouth and remove non-native fish from barrier to pure population in headwaters.
Habitat needs and activities: Modify/enhance existing barrier near the mouth.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Dry Fork Belt Creek <small>Continued on next page</small>	11 miles	Rainbow trout, Brook trout	Wild	General	Manage as recreational fishery with consumptive harvest.
		Westslope cutthroat trout	Wild	Conservation	Evaluate opportunities to expand population throughout the Dry Fork drainage if remediation of heavy metals pollution occurs
Habitat needs and activities: Maintain habitat and instream flows of 7 cfs. Identify potential barrier sites to develop a conservation population of westslope cutthroat trout.					
Oti Park Creek	4.2 miles	Brook trout	Wild	Suppression	Manage to minimize expansion of brook trout population.
		Westslope cutthroat trout	Wild	Conservation	Maintain or enhance population.
Habitat needs and activities:. Pursue construction of a barrier at a remote site to protect a good population of nearly pure WCT from an expanding brook trout population if a barrier is not installed on Dry Fork Belt Creek. The site would likely require a helicopter concrete pour.					
Carpenter Creek	3 miles	Westslope cutthroat trout	Wild	Conservation	Evaluate opportunities to expand population and provide secure habitat throughout the Carpenter Creek drainage in anticipation of mine remediation and metals pollution in the Carpenter-Snow Creek drainage.
Habitat needs and activities: Identify potential barrier sites near mouth to develop a conservation population of Westslope cutthroat trout.					
Jefferson Creek	5.4 miles	Brook trout	Wild	General	Manage to minimize increases in population densities.
		Rainbow trout	Wild	Suppression	Manage to minimize presence in the stream.
		Westslope cutthroat trout	Wild	Conservation	Maintain or enhance population to eventually allow limited harvest.
Habitat needs and activities: Explore potential barrier sites on Belt Creek to prevent non-native fish migration into Jefferson Creek.					
Chamberlain Creek	5.4 miles	Westslope cutthroat trout	Wild	Conservation	Monitor Chamberlain Creek above barrier for presence of brook trout.
Habitat needs and activities: The existing barrier is suspect at high flows because of screen clogging and erosion under the splash pad. Future work should be conducted to modify the screen to pass debris and the splash pad should be extended downstream to prevent passage of non-native fish during significant flow events.					

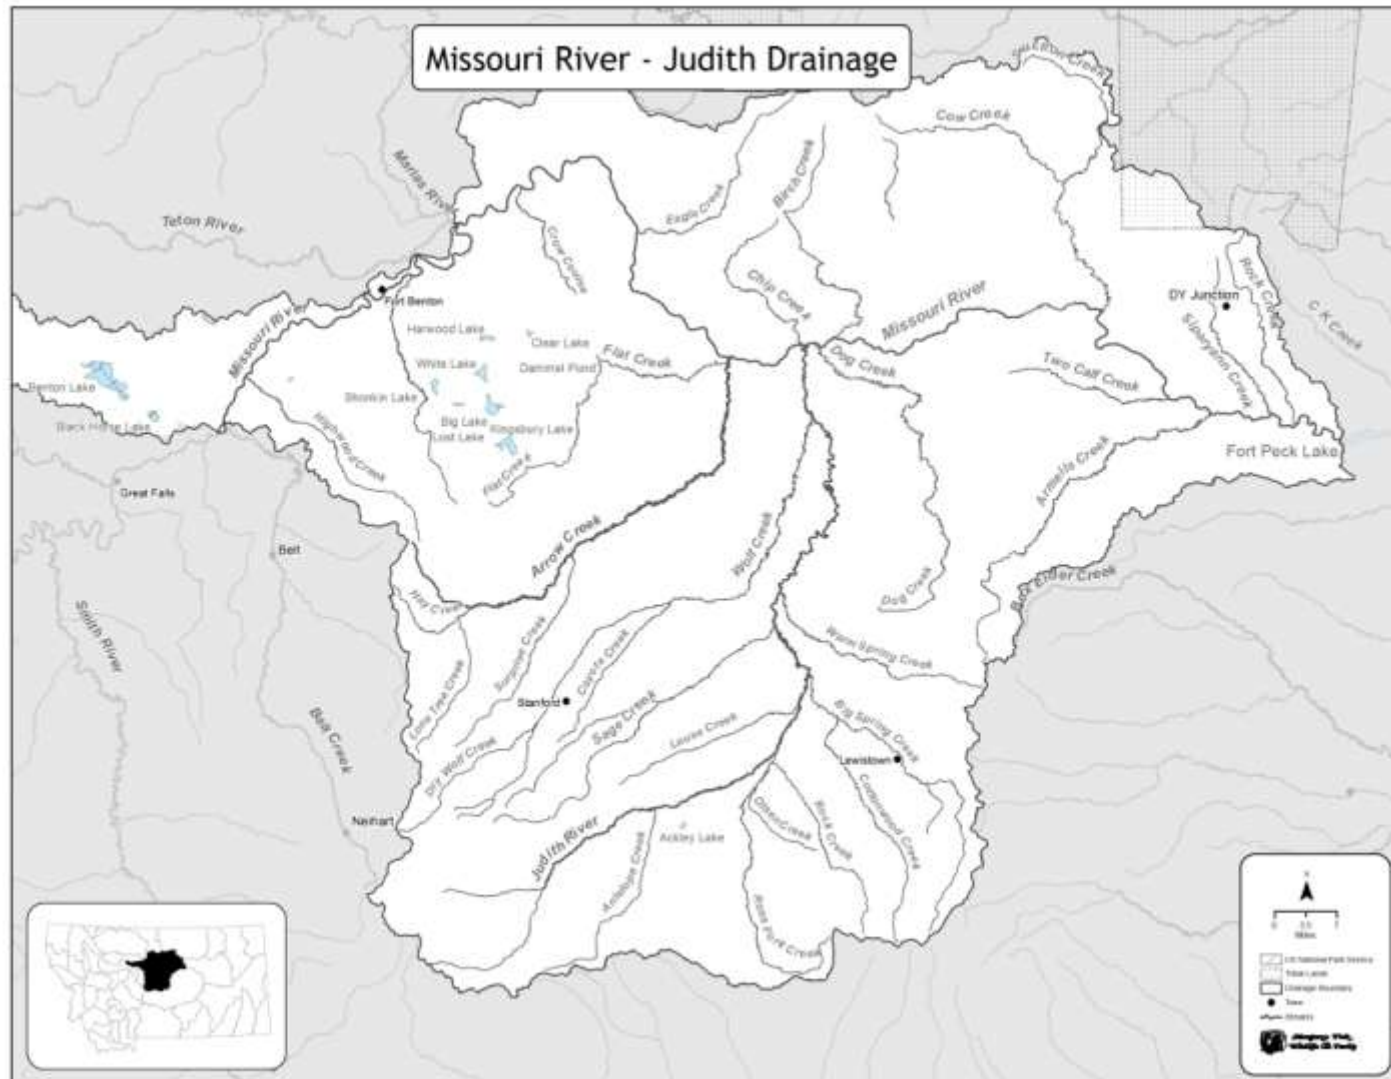

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Belt Creek (Big Otter Creek to Confluence with Missouri River)	37 miles	Rainbow trout, Brown trout	Wild	General	Maintain populations with historic levels providing for consumptive use.
		Mountain whitefish	Wild	General	Maintain numbers within historic range.
		Sauger	Wild	Conservation	Evaluate potential to restore populations.
Habitat needs and activities: Maintain habitat and instream flows of 35 cfs.					
Little Belt Ceek	15.8 miles	Rainbow trout, Brown trout	Wild	General	Maintain a recreational fishery with consumption in majority of stream below barriers.
		Brook trout	Wild	Suppression	Pursue removal of brook trout above a barrier on private land to benefit WCT in Little Belt Creek population and provide an additional layer of security for the North Fork and Middle Fork Little Belt Creek WCT populations.
		Westslope cutthroat trout	Wild	Conservation	Pursue opportunities to expand existing Little Belt Creek population downstream to barrier on private land.
Middle Fork Little Belt Creek	2.6 miles	Brook Trout	Wild	Suppression	Suppress brook trout population above barrier to protect WCT population.
		Westslope cutthroat trout	Wild	Conservation	Monitor the WCT population annually. Expand population downstream if private landowners are amenable.
Habitat needs and activities: Eradication of brook trout above a waterfall barrier on private land would create a WCT population resistant to long-term extinction threats and would include the North Fork and Middle Fork Little Belt drainages.					
North Fork Little Belt Creek	2.4 miles	Brook Trout	Wild	Suppression	Suppress brook trout population above barrier to protect WCT population.
		Westslope cutthroat trout	Wild	Conservation	Monitor the WCT population annually. Expand population downstream if private landowners are amenable.
Habitat needs and activities: Eradication of brook trout above a waterfall barrier on private land would create a WCT population resistant to long-term extinction threats and would include the North Fork and Middle Fork Little Belt drainages.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams (Isolated Single Species Populations)	33 miles	Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk. Allow harvest in robust populations.
Habitat needs and activities: Maintain or improve habitat and explore suitable sites for barriers or reducing fragmentation of WCT occupied habitat.					
Westslope Cutthroat Trout Genetically Altered Conservation Population Streams	59 Miles	Westslope cutthroat trout, Hybrids (mixed populations)	Wild	Conservation	Maintain or enhance populations. Allow harvest in robust populations.
Brook Trout Streams	197 Miles	Brook trout	Wild	General	Manage for a consumptive harvest.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

MISSOURI RIVER – JUDITH DRAINAGE

PHYSICAL DESCRIPTION

The reach of the Missouri River from Great Falls to the mouth of the Marias River is 54 miles in length. Stream gradient averages 4.8 feet/mile and varies from 18.7 feet/mile at the mouth of Belt Creek to 2.2 feet/mile near the mouth of the Marias River. The principal tributaries entering this reach are Belt, Highwood and Shonkin creeks. Belt Creek contributes a noticeable flow to the Missouri only during the spring runoff period. Belt Creek is presented in a separate section.

The Missouri River from the confluence of the Marias River to the confluence of the Judith River is 67 miles in length. The stream gradient averages 2.1 feet/mile and varies from 3.0 feet/mile near the mouth of Arrow Creek to 1.5 feet/mile at Coal Banks Landing. The Marias River is the only tributary stream in this reach which contributes a noticeable flow to the Missouri. It is discussed in its own section.

The reach of the Missouri River from the confluence of the Judith River to Fort Peck Reservoir is variable due to water elevations in the reservoir, but approximately 85 miles in length. Stream gradient averages 1.9 feet/mile and varies from 3.2 feet/mile near Stafford Ferry to less than 1 foot/mile as the river enters the reservoir. The Judith River is the only tributary stream in this reach that contributes a noticeable flow to the Missouri.

The Judith River is the third largest tributary to the Missouri River in the reach between Canyon Ferry and Fort Peck dams. This stream drains an estimated 2,000 square miles of the Little Belt, Big Snowy, Judith and the North and South Moccasin mountains and surrounding lands of central Montana. The Judith flows northward for 129 miles to its confluence with the Missouri River about 50 air miles north of Lewistown. Major tributaries include the Middle, South and Ross Forks, Big Spring and Warm Spring creeks, and Wolf Creek. Many of the tributary streams go subsurface near the foothills into the limestone geology and emerge downstream. Big Springs Creek and Warm Springs are primarily spring-fed creeks, while Cottonwood Creek, the South Fork Judith River, and the headwaters of Wolf Creek have long reaches that are dry in at least late summer.

The upper Judith River is situated in the mountainous area of the Lewis and Clark National Forest with its tributaries originating at an elevation of about 8,000 feet. The river begins at the confluence of the Middle and South forks and flows within a broad valley through prairie foothills and bench lands. The riparian vegetation, for about half its length consists of dense willow and other shrubs adjacent to hay meadows. Below this, cottonwoods begin to dominate the overstory along with an undergrowth of willows and rose. The average stream gradient is 30 feet/mile. Channel substrate is composed mostly of cobbles and gravel with moderate amounts of siltation.

The lower Judith River, from Big Spring Creek to the confluence with the Missouri River (elevation of 2,430 feet) is a prairie stream receiving run-off from adjacent lowlands and surrounding isolated mountain ranges. It follows a narrow river valley through prairie bench lands and rugged breaks. The river valley averages about one-half mile wide and becomes progressively more deeply entrenched in a downstream direction. Riparian vegetation consists of deciduous woodland dominated by an overstory of cottonwoods with a dense shrubby undergrowth of willows, rose and snowberry. The average stream gradient was 12 feet/mile in 2010, but historic flooding in 2011 has shortened stream length with numerous channel avulsions and increased gradient below Ross Fork Creek. Channel substrate is mostly composed of cobbles and gravel with increasing amounts of siltation downstream.

Land uses in the Judith River drainage are fairly diverse. Basin wide, timber harvest on forest lands has been moderate; however, the South Fork of the Judith has been intensively logged. Agricultural uses occur throughout the drainage. Livestock grazing is moderate on the public forest lands of the upper basin and is a major agricultural practice in the lower basin. Nearly all of the land is privately owned and managed for cattle ranching and farming. Hay and some crop lands exist along the river and are more extensive in the upstream areas. Irrigation is also more intensive here, resulting in severe dewatering of the Judith River for several miles. An offstream storage reservoir, Ackley Lake, located along the upper section of the Judith, stores 6,140 acre-feet and provides irrigation to 1,621 acres. Mining activities in the basin date back to the late 1800s. Gold was the primary mineral sought in the Yogo area of the Little Belt Mountains, however, sapphire mining also proved to be commercially successful. Gold mining was also pursued in the North Moccasin and Judith mountains. Presently, only a minimal amount of mining is ongoing in the Judith River Basin. Water quality issues have developed at a former open-pit gold mine that operated in the North Moccasin Mountains at Kendall. The area where sapphire mining produced commercial quantities near Yogo Creek is an area also popular with recreational placer miners.

Arrow Creek originates in the Little Belt and Highwood mountain ranges and drains portions of Judith Basin, Fergus, and Chouteau counties. The Arrow Creek watershed, occupying approximately 1,224 square miles, lies west of the Judith River drainage and Arrow Creek flows northward into the Missouri River. Major tributaries include Flat Creek, Lone Tree Creek, and Cottonwood Creek. Agricultural uses occur throughout the drainage and most lands are managed for cattle ranching and farming. In the northern part of the drainage, the creek flows through badlands on its way to the Missouri River. Arrow Creek has a fairly natural hydrograph and may be dewatered in late summer and early fall during dry years. The Arrow Creek drainage is more arid than the Judith basin, with the headwaters holding less snow for a shorter period of time. Double peaked hydrographs can result from prairie snow melting in March and summer thunderstorms causing short-duration, high-intensity discharges. Arrow Creek's channel is very sinuous. Much of the bottomland is privately owned, although DNRC trust lands and BLM-managed lands compose a greater percentage than in the Judith River Basin.

Arrow Creek flows through a wide valley bottom of Quaternary alluvium and these deposits of modern day channels are set within a canyon of sedimentary layers. The wide alluvial valley and

floodplain surround a C-channel type, which characterizes most of lower Arrow Creek, being low in gradient, meandering, and with point-bars and riffle/pool morphology. The cottonwood forest on Arrow Creek is dominated by plains cottonwood. Other riparian tree and shrub species include peach-leaf willow, yellow willow, and sandbar willow. Although present, Russian olives are not found in high densities.

FISHERIES MANAGEMENT

The middle Missouri River supports a diverse warmwater fishery. All of the native fish species that historically occurred here are still found in this reach because of the relatively unaltered state of the river. There are substantial angling opportunities for sauger, walleye, channel catfish, shovelnose sturgeon, smallmouth bass, freshwater drum, burbot and a wide variety of nongame species. The FWP fisheries objective for the middle Missouri River is to emphasize native species management.

The reach of the Missouri River below Morony Dam includes a transition zone between coldwater and warmwater fisheries. The Highwood and Shonkin creek drainages support trout fisheries. Shonkin Creek also has a robust prairie fish assemblage. Thirteen species, including smallmouth bass, were sampled near the mouth in 2004. Sauger have been historically the most abundant game fish found throughout this reach of the Missouri that extends down to the Marias; numbers appear to have declined in recent years. The coldwater game fish include brown and rainbow trout and mountain whitefish. These species are fairly common only in the upper 15 miles. Other cool/warmwater fish found in this reach include burbot, smallmouth bass, channel catfish, shovelnose sturgeon, northern pike, freshwater drum, blue sucker, and goldeye. Forage fish studies on the Missouri River indicate side channels are important habitat areas displaying higher fish diversity and abundance compared to open river areas. Side channel areas are also important rearing areas for goldeye, smallmouth buffalo and bigmouth buffalo. Young-of-the-year and forage fish are thought to use the side channel areas from early June through the end of August; flows of 4,500 cfs are required to keep side channels functional in this reach. Prior research also determined that paddlefish residing in Fort Peck Reservoir and the lower middle Missouri River require a flow of 14,000 cfs at Virgelle to initiate spring migrations to upstream spawning sites. Based on calculations made from USGS data gathered at the Virgelle and Fort Benton gaging stations, it was determined the Missouri River at Fort Benton contributes 80.6% of the median flow of the Missouri River at Virgelle. Therefore, to maintain the annual spring paddlefish migration in downstream reaches, it is recommended that the Missouri River discharge at Fort Benton be maintained at 80.6% of 14,000 cfs, or 11,284 cfs, during the spawning period, which was estimated to be from May 19 to July 5 annually.

Below the mouth of the Marias, the shovelnose sturgeon are amongst the largest found anywhere within the geographical range of the species. Paddlefish, a Species of Concern, inhabit the reach between the Marias and the mouth of the Judith River only during its spawning season. For most of their lives, paddlefish are found in Fort Peck Reservoir. When the Missouri rises to a flow greater than 12,000 cfs during the spring, paddlefish are triggered to leave the reservoir and migrate upstream to spawn. Females make this migration every 2-3 years and males every 1-2

years. Paddlefish have been observed as far upstream as the mouth of the Marias River when flows are extremely high. Previous research identified four spawning areas between the Marias and the Judith. Paddlefish receive light fishing pressure in the reach because of limited access and lack of paddlefish concentrations. Twenty-two non-game species have been found in this reach of the Missouri. Blue sucker, smallmouth buffalo, bigmouth buffalo and freshwater drum are four nongame migratory species that are dependent on high spring flows for successful reproduction that inhabit this reach. In addition to the paddlefish, the endangered pallid sturgeon, the threatened shovelnose sturgeon, as well as sturgeon chub and blue sucker (Species of Concern), use this reach. Pallid sturgeon numbers have increased in this reach as a result of ongoing recovery work.

The third reach of the middle Missouri, from the Judith River to Fort Peck Reservoir, supports a warm water fishery. Sauger, shovelnose sturgeon, channel catfish and walleye are the common game fish found in the reach. A major paddlefish snagging fishery exists in the lower 40-mile reach of the middle Missouri River during the spring. There is currently a harvest cap of 500 fish on this paddlefish population, but in 2011 it was estimated about 600 paddlefish were harvested during 14,000 angler days. Future management efforts will be designed to reduce chances of overharvest and maintain a self-sustaining population. FWP's management of paddlefish is discussed in more detail in the special management issues section of this drainage. Several tributaries with prairie fish assemblages, such as Armells Creek (81 miles long), Cow Creek and Eagle Creek, enter in this reach.

In the Judith River drainage, brown trout are the predominant game fish found throughout the reach from the confluence of the South and Middle Forks to Big Spring Creek, followed by mountain whitefish and rainbow trout. A population of brook trout exists in the upper portion of the reach where several springs originate and flow into the river. Non-game species include mountain, white and longnose suckers, longnose dace and Rocky Mountain sculpin. The Judith River receives a moderate amount of fishing pressure in this reach.

The reach of the Judith River from the mouth of Big Spring Creek to the Missouri is primarily a warm water fishery where sauger and channel catfish are the most abundant game fish. Cold water game fish, including rainbow and brown trout and mountain whitefish, also inhabit this reach seasonally but occur in low numbers during the summer. Twelve non-game species have been found in the Judith River. They include goldeye, carp, western silvery minnow, flathead chub, longnose dace, stonecat, longnose sucker, mountain sucker, and shorthead redhorse all of which are common. Uncommon species present include white sucker, river carpsucker and Rocky Mountain sculpins. In addition, blue suckers migrate into this reach to spawn. The lower Judith River has a diverse fishery, which reflects the variety of habitat conditions present and the transition from a coldwater to a warmwater environment. The lower Judith River receives only a light amount of fishing pressure, most likely due to its remote and fairly inaccessible location.

Rainbow trout are the most abundant game fish in the lower reaches of the South Fork Judith River. Westslope cutthroat trout are more abundant in the headwaters and upper tributaries. Low numbers of brook trout are found throughout the South Fork. Sculpin and mountain whitefish are

common in the lower end above a dry reach. This stream receives substantial fishing pressure for its size. In the Lost Fork Judith River, brook trout are the predominant game fish, followed by rainbow and westslope cutthroat trout hybrids. Rocky Mountain sculpin are found throughout the stream's length. The Lost Fork receives light fishing pressure because of its remote location. Rainbow trout are the most abundant game fish found throughout the Middle Fork Judith River. They are the dominant species found in the canyon area, but are less numerous near the mouth. Brook trout are fairly abundant in the headwater streams and become fairly abundant again near the mouth. Other species present include cutthroat x rainbow hybrids, brown trout and sculpins. The Middle Fork receives a moderate amount of fishing pressure considering its remote location. Yogo Creek, a tributary to the Middle Fork is a popular brook trout and hybrid rainbow trout fishery. It has many dispersed camping sites and a dense rainbow trout and brook trout population.

Big Spring Creek is exceptionally productive, and for its size, is rated as one of Montana's finest fishing waters. The creek is considered the most important trout stream in central Montana. Rainbow and brown trout are the major game species in this reach. Until the last five years, rainbow trout made up the majority of the population, but recently brown trout have been about 50% of the population downstream of Lewistown. Mountain whitefish are also present, along with a few brook trout. Northern pike and walleye are occasionally found. Nongame fish species found in this reach include Rocky Mountain sculpin, longnose dace, longnose sucker, white sucker, mountain sucker, shorthead redhorse, carp and lake chub. Big Spring Creek receives a substantial amount of angler use. The 1982-2009 mail survey of Montana anglers estimated there was an average of 9,833 angler days of use per year on the creek. The majority of use is by bank fishermen; however, Big Spring Creek does receive a considerable amount of floating use. Most floating activity is related to swimming, canoeing, duck hunting, and bird watching. Cottonwood Creek is the main tributary to Big Spring Creek. The fisheries in Cottonwood Creek transition from westslope cutthroat trout in the headwaters to brook trout in the foothills and rainbow and brown trout toward the confluence with Big Spring Creek.

Rainbow trout are the most abundant game fish found in Warm Springs Creek. Water temperatures appear to be above the tolerance levels for rainbow trout spawning, so the population is one of the few streams maintained by stocking. Smallmouth bass were introduced during 1973 and annual stocking has continued. Brown trout and sauger are generally found in low numbers. Other species occurring in Warm Springs Creek include brook trout, channel catfish, common carp, and longnose, white and mountain suckers, shorthead redhorse, longnose dace, fathead minnow, goldeye, yellow perch and Rocky Mountain sculpin. The riparian and aquatic habitats are generally in good condition in the upper portion of the reach. However, poor agricultural practices, including overgrazing by livestock, have caused excessive bank erosion and increased siltation of the stream channel in some channel reaches.

The Arrow Creek drainage contains a warmwater fishery in its lower reaches that includes goldeye, channel catfish, stonecat, and northern redbelly x finescale dace hybrid. In its headwaters, brook, and westslope cutthroat trout are present. There are approximately 47 miles

of suitable habitat for salmonids. Probably 43 of these miles are inhabited by brook trout, and 4 miles by westslope cutthroat trout.

HABITAT

Present-day flow regimens of the Missouri River in the reach from Morony Dam to the mouth of the Marias are not natural because of regulation and storage at several upstream dams. Flow is largely controlled by Canyon Ferry Reservoir. There are five hydroelectric dams within the Great Falls area that are operated by the PPL Montana. These dams do not typically affect streamflows because the FERC order that licenses the operation of the dams, stipulates that Morony Dam is to be operated to maintain uniform flows downstream. Long-term flow records are available for two USGS gage sites within this reach. For the gage site at the head of the reach below Morony Dam, the average annual flow for a 54-year period of record (1957-2011) was 7,395 cfs. Mean monthly flows ranged from 5,520 cfs in September to 13,800 cfs in June. The average annual flow for a 121-year period of record (1891-2011) at the Fort Benton gage site was 7,608 cfs. Mean monthly flows range from 4,890 cfs in September to 18,200 cfs in June.

In the second reach from the confluence of the Marias River to the confluence of the Judith River, the Marias River discharge augments the Missouri River flows by about 10% during most of the year. Present day flow regimens in this reach are similar to the reach upstream of the Marias. The Marias does not greatly increase spring flows in the Missouri because of flood control and regulation by Tiber Reservoir. However, it may be useful in the future to restore a more natural flow regime to the Missouri River. Long-term flow records are available for the USGS Virgelle gage station located 18 miles below the confluence of the Marias River. The average annual flow for a 76-year period of record (1936-2011) was 8,320 cfs. Mean monthly flows ranged from 5,830 cfs in September to 17,800 cfs in June.

In the lowest reach from the confluence of the Judith River to the headwaters of Fort Peck Reservoir, the Judith River augments the Missouri River by about 5% throughout most of the year. Present-day flow regimens of the Missouri River are similar to the upstream reach and are regulated by upstream reservoirs. Long-term flow records are available for the Fred Robinson Bridge USGS gaging station located 23 miles above Fort Peck Reservoir. The average annual flow for a 77-year period of record (1935-2011) was 8,988 cfs. Mean monthly flows range from 6,180 cfs in September to 19,400 cfs in June.

FISHING ACCESS

Adequate access has been developed at most accessible locations on the Middle Missouri Wild and Scenic River reach. About 80% of the Missouri River in this reach lies within the Upper Missouri River Breaks National Monument and the Charles M. Russell National Wildlife Refuge. The river is also classified as a Wild and Scenic, and there are motorboat use restrictions on some segments from June 15 – September 15. Recreational access is limited in the area, with only 8 boat ramps throughout the reach located at Widow Coulee (river mile 2102), Carter Ferry (river mile 2089), Fort Benton (river mile 2073), Loma (river mile 2053), Coal Banks (river mile 2032), Judith Landing (river mile 1982), Robinson Bridge (river mile 1921) and Rock Creek

(river mile 1907). The reach of the Missouri River from Great Falls to the mouth of the Marias River includes the upper 21 miles of the Upper Missouri National Wild and Scenic River, which begins midway in the reach at Fort Benton. From this point, the Missouri receives heavy recreational use even though there are few access points. Access to the river is limited because of the rugged terrain and lack of development within the narrow river corridor. Public access points include a ferry crossing with adjacent FAS primitive boat ramp, a campground with a boat ramp, and a bridge crossing plus the Morony Dam area, and the Fort Benton town site.

From the confluence of the Marias to the confluence of the Judith River, the entire reach is within the Upper Missouri National Wild and Scenic River corridor, and most is within the Upper Missouri River Breaks National Monument. Nearly half of the use in this reach is recreational boating. Other activities include fishing, hunting, picnicking, camping and trapping. About 40% of the river is bordered by BLM land. The greater portion of public land is located in the lower 30 miles of the reach. Most of the public land is difficult to reach, other than by floating because of the rugged terrain and lack of development within the narrow river corridor. There is one ferry crossing, a bridge and two campgrounds where the public can access the river.

From the confluence of the Judith River to Fort Peck Reservoir, 62 miles of this reach are within the Upper Missouri National Wild and Scenic River. This portion of the Missouri includes the rugged breaks country. There is considerable recreational use in this portion of the Missouri because of its nationally renowned beauty and wilderness qualities, fishing and hunting opportunities. The upper portion of this reach is within the Upper Missouri River Breaks National Monument, and the lower 23 miles of the reach is surrounded by the Charles M. Russell National Wildlife Refuge. Nearly the entire river in this reach is bordered by land administered by the BLM or USFWS. Most of the reach is difficult to access, other than by floating, because of the rugged terrain and large areas of roadless country. Access is limited to three bridge or ferry crossings. Only a few vehicle trails lead down to the river, with most of these being located in the lower 23 miles of river.

The Judith River is a popular recreation area for fishing, hunting, picnicking, camping, hiking and floating. The headwaters of the Judith and its tributary drainages are generally on USFS lands and have sufficient public access. A considerable portion of the forested land in the upper basin is managed for semi-primitive recreation. Access to the Judith River varies along its course. The first 25 miles is paralleled by a county road with several bridge crossings. For the next 45 miles there are only a few roads near the floodplain, but several county roads and highways cross the river at bridges. The remaining 60 miles flow through remote badlands where there are only two access points, including at the confluence with the Missouri. Most of the land adjacent to the stream is privately owned, but access is generally allowed with permission. Additional access is needed on the Judith River downstream of the South and Middle forks, on Warm Springs Creek, and Big Spring Creek downstream of Cottonwood Creek. FWP already has eight FASs on Big Spring Creek, but the additional access needs are due to it being a stream that is most easily accessed from the bank, rather than boat.

SPECIAL MANAGEMENT ISSUES

FWP has worked closely with numerous partners in the Arrow, Judith and Mid Missouri drainages to help preserve and restore the unique native and wild fisheries available in these systems. Recent partners have included the PPL Montana, Montana State University, University of Idaho, BOR, and Western Area Power Administration, and the USFS. Projects have included assisting with pallid sturgeon restoration, paddlefish population research, and research on other native riverine species. An ongoing effort in cooperation with USFS has successfully increased and restored pure westslope cutthroat trout into the headwaters of several streams in the Judith, Arrow and Highwood drainages. Additional work is needed.

An additional USGS gaging station in the Judith near Utica (historic site) or near Hobson would allow better monitoring of drought conditions and instream flows in this drainage. The entire Judith drainage currently has only one USGS gaging station.

A particularly important issue in this drainage involves paddlefish management. Paddlefish anglers have seen several changes to the regulations and season structure since 2006. The current paddlefish season runs from May 1st to June 15th and the harvest of paddlefish closes once the estimated harvest reaches the cap of 500 paddlefish. Anglers are allowed to snag and release paddlefish throughout the season, regardless of whether or not they already harvested a paddlefish. The 500-fish harvest cap has been met or exceeded in all but one year (2008) since its implementation in 2008. Furthermore, the date in which the harvest of paddlefish closed has occurred earlier each consecutive year thereafter. In 2009 the harvest cap was reached on May 22nd, in 2010 it was reached on May 16th, in 2011 and 2012 the harvest cap was reached on May 14th and May 10th, respectively. The current paddlefish season structure has put more pressure on paddlefish anglers to get to the river early enough to have a chance at harvesting a fish before the season closes. Anglers have voiced their concerns over the crowding issues created and difficulty in planning a fishing trip under the current season structure. FWP will continue to evaluate and modify the paddlefish season structure with regard to paddlefish management and concerns expressed by paddlefish anglers.

FWP will also continue to tag adults in the spring to track movement, growth, and estimate population size. Young-of-year transects will be conducted in late summer to estimate reproductive success as it pertains to spring flows on the Missouri River and Fort Peck Reservoir water elevations (rearing habitat). Creel surveys will continue to be conducted during the paddlefish season on the Missouri River from river mile 1921 to 1899 (James Kipp Recreation Area and Campground to Lower Peggy's Bottom), and a phone creel survey will be conducted after the season. These measures are critical to maintain the paddlefish population at a sustainable level.

FISHERIES MANAGEMENT DIRECTION FOR THE MISSOURI RIVER - JUDITH DRAINAGES

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Missouri River – Great Falls to Confluence with the Marias River	54 miles	Sauger	Wild	Conservation/ Special Regulations	Maintain populations within historic levels and manage as a recreational fishery with limited harvest.
		Walleye, Northern pike, Freshwater drum, Smallmouth bass	Wild	General	Manage as a recreational fishery with consumptive harvest.
		Rainbow trout, Brown trout , Shovelnose sturgeon, Channel catfish	Wild	General	Maintain populations within historic levels and manage as a recreational fishery.
		Mountain whitefish	Wild	General	Maintain populations within historic levels.
		Goldeye	Wild	General	Manage as a recreational fishery with some consumptive harvest.
		Blue sucker, Stonecat	Wild	Conservation	Maintain populations within historic levels.
Habitat needs and activities: Maintain stream flows of 3,700 cfs from 9/1-3/14 for maintenance of riffles, 4,887 cfs from 3/14-5/18, 11,284 cfs from 5/19-7/5 for paddlefish spawning migration, and 4,500 cfs from 7/6-8/31 for maintaining side channel habitat for forage species.					
Highwood Creek	37.6 miles	Rainbow trout, Brown trout, Brook trout	Wild	General	Maintain populations within historic levels and manage as a recreational fishery.
Habitat needs and activities: Maintain 10 cfs for instream flows to maintain aquatic habitat.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Highwood Creek Drainage - Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams (Isolated Single Species Populations) (1 Stream)	2 miles	Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk.
Highwood Creek Drainage - Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams (Isolated Single Species Populations) (2 Streams)	5-7 miles	Westslope cutthroat trout	Wild	Conservation	Continue work to establish two new populations of 100% genetically unaltered WCT populations to reduce extinction risk.
Shonkin Creek	52 miles	Brook trout	Wild	General	Manage as a recreational fishery with consumptive harvest
Habitat needs and activities: Maintain instream flow of 7 cfs for aquatic habitat.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Missouri River - Confluence of the Marias River to the Judith River	67 miles	Sauger	Wild	Conservation/ Special Regulations	Maintain populations within historic levels, manage as a recreational fishery with limited harvest.
		Walleye, Northern pike, Freshwater drum, Smallmouth bass	Wild	General	Manage as a recreational fishery with consumptive harvest.
		Shovelnose sturgeon, Channel catfish	Wild	General	Maintain populations within historic levels and manage as a recreational fishery.
		Pallid sturgeon	Hatchery/Wild	Conservation	Maintain and enhance existing population levels to reduce extinction risk.
		Paddlefish	Wild	Special regulations	Maintain populations within biologically healthy levels and manage as a recreational fishery with limited harvest through a cap system.
		Burbot	Wild	General	Maintain populations within historic levels.
		Goldeye	Wild	General	Manage as a recreational fishery with some consumptive harvest.
		Blue sucker	Wild	Conservation	Maintain populations within historic levels.
Habitat needs and activities: Maintain 4,300-14,000 cfs for instream flows as indicated by the following to maintain fisheries. Maintain stream flows of 4,300 cfs from 9/1-3/14 for maintenance of riffles, 5,571 cfs from 3/14-5/18, 14,000 cfs from 5/19-7/5 for paddlefish spawning migration, and 5,400 cfs from 7/6-8/31 for maintaining side channel habitat for forage species.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Missouri River - Confluence of the Judith River to the headwaters of Fort Peck Reservoir	85 miles	Sauger	Wild	Conservation/ Special Regulations	Manage to maintain populations within historic levels in upper reaches and provide a recreational fishery with limited harvest.
		Walleye, Freshwater drum, Smallmouth bass	Wild	General	Manage as a recreational fishery with consumptive harvest.
		Shovelnose sturgeon, Channel catfish	Wild	General	Maintain populations within historic levels and manage as a recreational fishery.
		Pallid sturgeon	Hatchery/Wild	Conservation	Maintain and enhance existing population levels to reduce extinction risk.
		Paddlefish	Wild	Special Regulations	Maintain populations within biologically healthy levels and manage as a recreational fishery with limited harvest through a cap system.
		Burbot	Wild	General	Maintain populations within historic levels.
		Goldeye	Wild	General	Manage as a recreational fishery with some consumptive harvest.
		Stonecat	Wild	Conservation	Maintain populations within historic levels.
Habitat needs and activities: Maintain 4,700-15,302 cfs for instream flows as indicated by the following to maintain fisheries. Maintain stream flows of 4,700 cfs from 9/1-3/14 for maintenance of riffles, 7,100 cfs from 3/14-5/18, 15,302 cfs from 5/19-7/5 for paddlefish spawning migration, and 5,800 cfs from 7/6-8/31 for maintaining side channel habitat for forage species.					
Arrow Creek – Lower Reaches	64 miles	Channel catfish	Wild	General	Maintain populations within historic levels and manage as a recreational fishery.
Goldeye		Wild	General	Manage as a recreational fishery with some consumptive harvest.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Stonecat, Northern redbelly x finescale dace hybrid	Wild	Conservation	Maintain populations within historic levels.
Arrow Creek Headwaters - Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams (Isolated Single Species Populations) (2 Streams)	4 miles	Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk.
Habitat needs and activities: Examine methods to protect one population from competition or hybridization.					
Arrow Creek Headwaters - Brook trout Habitat	43 Miles	Brook trout	Wild	General	Maintain recreational fishery for consumptive harvest where they pose no threat to westslope cutthroat trout populations.
Judith River - South /Middle Fork Confluence to Big Spring Creek	58 Miles	Rainbow trout, Brown trout, Brook trout Mountain whitefish	Wild Wild	General General	Manage as a recreational fishery with harvest. Maintain populations within historic levels.
Habitat needs and activities: Maintain 25 cfs for instream flows to maintain aquatic habitat.					
Judith River – Big Spring Creek to Mouth Continued on next page	71 Miles	Sauger	Wild	Conservation/ Special Regulations	Manage to maintain populations within historic levels and provide a recreational fishery with limited harvest.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Walleye, Northern pike, Rainbow trout, Brown trout Smallmouth bass	Wild	General	Manage as a recreational fishery with consumptive harvest.
		Channel catfish	Wild	General	Maintain populations within historic levels and manage as a recreational fishery.
		Goldeye	Wild	General	Manage as a recreational fishery with some consumptive harvest.
		Stonecat	Wild	Conservation	Maintain populations within historic levels.
		Mountain whitefish	Wild	General	Maintain populations within historic levels.
		Blue sucker	Wild	Conservation	Maintain spawning and rearing populations within historic levels.
Habitat needs and activities: Maintain 160 cfs for instream flows to maintain aquatic habitat. Improve flow monitoring and management by installing a stream flow gage station near Utica or Hobson.					
South Fork Judith River	20.6 miles	Rainbow trout, Brown trout, Brook trout	Wild	General	Manage as a recreational fishery with consumptive harvest.
		Westslope Cutthroat trout	Wild	Conservation	Maintain and secure genetically altered population from competition and continued hybridization.
		Mountain whitefish	Wild	General	Maintain populations within historic levels.
Habitat needs and activities: Maintenance of existing trout habitat by providing 3.5 cfs of instream flow.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Lost Fork Judith River	9 miles	Rainbow trout, Brook trout	Wild	General	Manage as a recreational fishery with consumptive harvest.
Habitat needs and activities: Maintain habitat and instream flows of 14 cfs.					
Middle Fork Judith River	13.1 miles	Rainbow trout, Brook trout, Brown trout	Wild	General	Manage as a recreational fishery with consumptive harvest.
Habitat needs and activities: Maintain habitat and instream flows of 22 cfs.					
Big Spring Creek –hatchery to Cottonwood Creek	23.7 miles	Rainbow trout, Brown trout	Wild	Special Regulations	Maintain a recreational fishery with no harvest until PCB cleanup completed. Evaluate allowing harvest after completion of cleanup.
		Mountain whitefish	Wild	Special Regulations	Maintain populations within historic levels with no harvest until PCB cleanup completed. Evaluate allowing harvest after completion of cleanup.
Habitat needs and activities: Maintain habitat and instream flows of 110 cfs. Restore habitat and channel form on channelized sections. Pursue additional access for bank anglers.					
Big Spring Creek – Cottonwood Creek to Mouth	8.2 miles	Rainbow trout, Brown trout	Wild	General	Maintain a recreational fishery with consumptive harvest.
		Mountain whitefish	Wild	General	Maintain populations within historic levels.
		Sauger	Wild	Conservation/ Special Regulations	Manage to maintain populations within historic levels and provide a recreational fishery with limited harvest.
Habitat needs and activities: Maintain habitat and instream flows of 100 cfs. Pursue additional access for bank anglers.					
East Fork Big Spring Creek	24.8 miles	Rainbow trout, Brook trout, Brown trout	Wild	Special Regulations	Maintain a recreational fishery with no harvest.
		Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk.
Habitat needs and activities: Maintain habitat and instream flows of 7.5 cfs.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Cottonwood Creek	32 miles	Brook trout Rainbow trout Brown trout	Wild	General	Maintain a recreational fishery with consumptive harvest
		Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk.
Habitat needs and activities: Maintain habitat and instream flow of 4.5 cfs in Cottonwood Creek.					
Beaver Creek (Tributary to Cottonwood)	13 miles	Brook trout	Wild	General	Maintain a recreational fishery with consumptive harvest.
Warm Springs Creek	28 miles	Rainbow trout	Hatchery	Put-Take	Maintain a recreational fishery with consumptive harvest with continued plants.
		Brown trout	Wild	General	Manage as a recreational fishery with consumptive harvest.
		Smallmouth bass	Hatchery	General	Manage as a recreational fishery with consumptive harvest.
		Sauger	Wild	Conservation	Maintain populations within historic levels and manage as a recreational fishery with limited harvest.
		Stonecat	Wild	Conservation	Maintain populations within historic levels.
Habitat needs and activities: Maintain habitat and instream flows of 110 cfs.					
Yogo Creek	13.7 miles	Brook trout, Rainbow trout	Wild	General	Manage as a recreational fishery with consumptive harvest to minimize potential for competition and hybridization of mixed WCT population.
		Westslope cutthroat trout	Wild	Conservation	Minimize threats to genetically altered population from competition and additional hybridization.
Habitat needs and activities: Maintain habitat and instream flows of 3 cfs.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

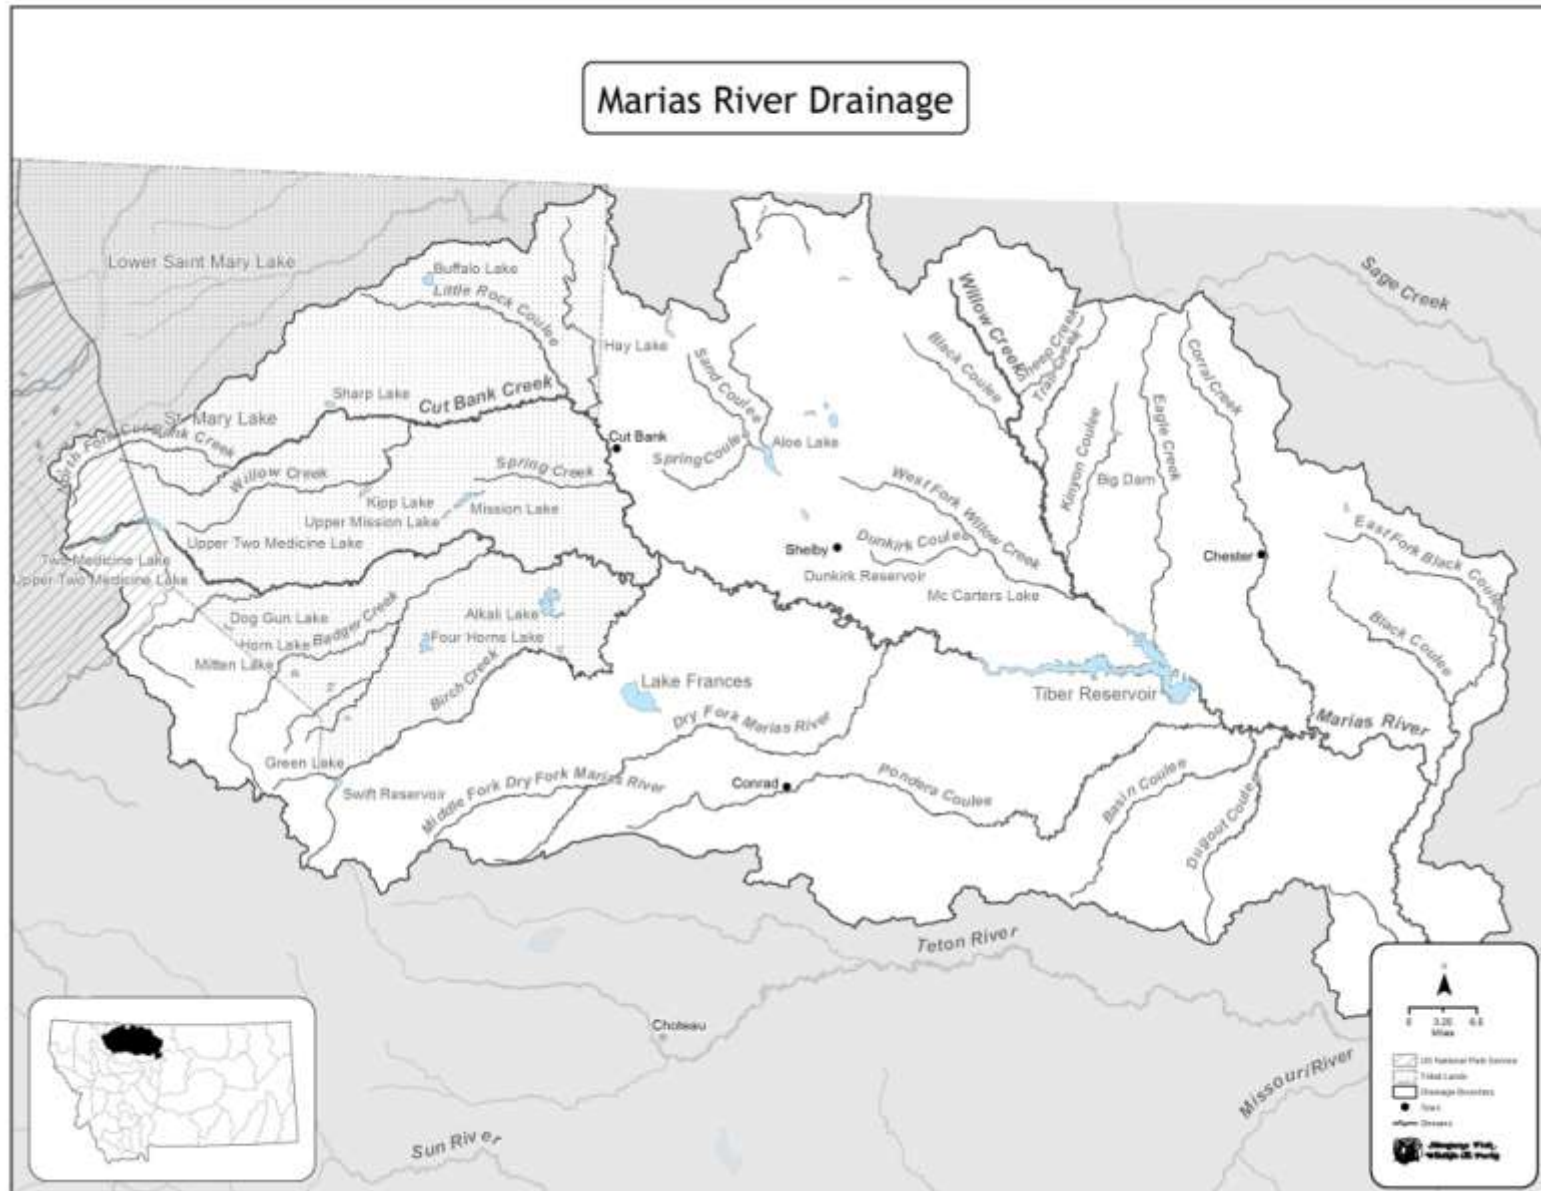

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Judith River Drainage - Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams (Isolated Single Species Populations) (5 Streams)	10 Miles	Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk.
Judith River Drainage - Westslope Cutthroat Trout Genetically Altered (10 Streams) & Mixed Population (10 Streams)	54.5 Miles	Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk. Explore options to limit non-natives in mixed populations.
Judith River Drainage - Brook Trout Streams	304 Miles	Brook trout	Wild	General	Maintain recreational fishery for consumptive harvest where they pose no threat to westslope cutthroat trout populations.
Ackley Lake	226 Acres	Rainbow trout	Hatchery	Put-Grow-Take	Maintain recreational fishery for consumptive harvest by continued stocking.
Habitat needs and activities: Work with water users to maintain minimum pool elevation.					
East Fork Reservoir	90 acres	Yellow perch	Wild	General	Maintain recreational fishery for consumptive harvest.
		Northern pike	Wild	Suppression	Maintain recreational fishery for consumptive harvest.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Largemouth bass	Hatchery	General	Develop recreational fishery for consumptive harvest by stocking.
		Rainbow trout	Hatchery	General	Develop recreation fishery for consumptive harvest if low levels of wild fish present.
Habitat needs and activities: Work with City of Lewistown and NRCS to explore opportunities to use stored water to meet instream flows of Big Spring Creek during time of drought.					
Lower & Upper Carter Ponds	57 acres	Rainbow trout	Hatchery	Put-Grow-Take	Maintain recreational fishery for larger sized fish and consumptive harvest by continued stocking.
Big Casino Creek Reservoir	16 acres	Rainbow trout	Hatchery	Put-Take	Maintain recreational fishery for larger sized fish and consumptive harvest by continued stocking.
		Yellow Perch	Wild	Suppression	Encourage harvest to control numbers. Evaluate using a predator to manage numbers.
Rhoda Lake	3 acres	Westslope cutthroat trout	Hatchery	Put-Grow-Take	Maintain native species (WCT or Arctic grayling) recreational fishery for consumptive harvest by continued stocking.
Cow Creek-Headwaters to Cow Creek Reservoir	8 miles	Brook trout	Wild	General	Protect habitat and provide fish passage when applicable.
Cow Creek Reservoir	82 acres	Brook trout, Yellow perch, Black crappie	Wild/Hatchery	General/Put-Grow-Take	Continue to monitor populations and stock when necessary.
		Tiger muskie	Hatchery	Quality	Manage tiger muskie for trophy fishery (fish > 40 inches).
		Channel catfish	Wild/Hatchery	Put-Grow-Take	Evaluate channel catfish population and supplement with stocking as needed.
		Walleye	Hatchery	Put-Grow-Take	Stock 5,000 walleye fingerling on alternate years.
Habitat needs and activities: Work with Sand Creek Ranch to repair dam and implement reservoir operations plan that benefits fish production. Maintain instream flow of 4.5 cfs in Cow Creek above reservoir to protect fish habitat.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Cow Creek- Cow Creek Reservoir Tailwaters to Confluence with Missouri River	46 miles	Native non- game fishes	Wild	Conservation	Protect habitat and provide fish passage when applicable.
Habitat needs and activities: Identify habitat issues and work closely with local conservation districts, county road crews, and landowners to implement safe water crossings which emphasis fish passage and water connectivity.					
Private & Public Ponds	-	Trout, Warm water species	Hatchery/Wild	Put-Take/General	Maintain existing pond fisheries available to the public for harvest.
Habitat needs and activities: Enhance structure in ponds when possible.					

MARIAS RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Marias River is the largest tributary of the Missouri River between Canyon Ferry and Fort Peck dams. This north-central prairie stream drains about 7,100 square miles of the Rocky Mountain Front and Lewis Mountain ranges. The Marias begins 12 miles north of Valier (elevation 3,280 feet) and flows 170 miles east and south to its confluence with the Missouri River near Loma (elevation 2,550 feet). Major tributaries include the Two Medicine River, Cutbank, Badger, and Birch creeks. The Teton River joins the Marias about 1 mile upstream from the Marias River's mouth, and is discussed in its own section. Within this geographic area there are 40 lakes or reservoirs, totaling 24,227 surface acres.

The upper Marias River basin is situated in the mountainous area of the Lewis and Clark National Forest and Glacier National Park. Its upper tributaries originate at an elevation of about 10,000 feet and flow out onto the prairie. There is little development in the foothill transition zone between the mountains and prairie. The Marias originates at the confluence of the Two Medicine River and Cutbank Creek about 35 miles east of the mountain zone. The upper mainstem reach flows 60 miles before entering the headwaters of Tiber Reservoir (Lake Elwell). Within this reach, the Marias flows through a rolling prairie landscape while entrenched in a well-defined valley about 1 mile wide. Soft shale and sandstone bluffs flank the river, rising 200 to 400 feet above the valley floor. The riparian vegetation consists of deciduous woodlands dominated by an overstory of cottonwoods and an undergrowth of willows, rose, and buffalo berry. The overall stream gradient is 5 feet/mile and varies from 11 feet/mile in the upper portion to less than 2 feet/mile in the lower end of the reach. Channel substrate consists primarily of cobbles and gravel with moderate amounts of siltation.

The lower Marias mainstem extends from Tiber Dam and flows for 78 miles to its confluence with the Missouri River. It lies in the semi-arid prairie lands at elevations between 3,000 and 4,000 feet. This area is moderately dissected with drainages that collect lowland runoff chiefly from March through June. With the exception of the Teton River, there are no perennial tributary streams joining the Marias. In fact, due to water management upstream, the lower Teton River has also not been perennial in most recent years. Flow regimens of the lower Marias River are completely regulated by the operations of Tiber Reservoir. Tiber Dam was completed in 1955 and is operated by the BOR. This reservoir stores the high spring runoff and augments base flows of the lower river.

Throughout its entire course, the lower Marias is entrenched in a well-defined river valley. The valley is about 3/4 mile wide at the upper and lower ends, and narrows in the middle to form a scenic canyon less than 400 yards wide. Shale and sandstone bluffs border the river and rise 200 to 400 feet above the narrow floodplain. The riparian vegetation is dominated by older cottonwood trees with a moderate undergrowth of rose and buffalo berry. Islands and lower floodplain areas support stands of willow. The floodplain throughout the lower river is in a static condition because of the regulated flows and the absence of regular flooding events. This has limited the abundance of early-aged cottonwood stands and other riparian vegetation dependent on flooding. The overall stream gradient is 3.5 feet/mile and varies only slightly from 3.0-4.5

feet/mile. Channel substrate is mostly composed of cobbles and gravel. Siltation increases in a downstream progression from Tiber Dam.

Land uses in the Marias River drainage are fairly diverse. In the forested areas of the upper basin, a considerable portion is in designated wilderness that includes the Bob Marshall Wilderness Area and Glacier National Park. Forest Service lands outside the Bob Marshall Wilderness Area are managed for semi-primitive recreation, livestock grazing, and minor amounts of timber harvest. A significant part of the upper basin is contained within the Blackfeet Indian Reservation, where fisheries resources are managed by the Blackfeet Tribe in cooperation with the USFWS. Grain and hay production and livestock grazing are principal uses which occur in the prairie lands of the upper and lower basins. Most of the land in this area outside the Blackfeet Reservation is privately owned. There are a few scattered parcels of federal land managed by either the BLM or BOR. These lands are primarily located along the perimeter of Tiber Reservoir and areas adjacent to the lower Marias River. The river and surrounding lands are important recreation areas. Fishing, hunting, picnicking, and floating are popular activities associated with the river environment.

FISHERIES MANAGEMENT

The headwaters of the Marias River include Cutbank Creek and the Two Medicine River, which join to form the Marias River just south of Cutbank, Montana. Cutbank Creek, from where it leaves the Blackfeet Reservation and forms the eastern reservation boundary, is primarily a coldwater stream with rainbow and brown trout and mountain whitefish in its lower 19 miles. However, chronic dewatering limits its fisheries potential. The Two Medicine River flows approximately 40 miles from west to east, much of it on the Blackfeet Reservation. The Two Medicine River drainage contains larger tributaries, which are Badger, Birch, and Dupuyer creeks, and consists of about 773 miles of perennial streams. Approximately 123 perennial streams are named within the Two Medicine subbasin. The headwater tributaries to the Two Medicine River are generally cold and unproductive with low densities of trout.

The headwater drainage currently supports approximately 240 miles of stream inhabited by brook trout, 194 miles that support rainbow trout, 41 miles that support genetically unaltered westslope cutthroat trout in 12 streams, and 33 miles of stream containing genetically altered (hybridized) WCT in 11 streams. The brook and rainbow trout are managed as recreational fisheries with consumptive harvest, while the unaltered WCT are being managed to maintain or enhanced their populations to reduce the risk of extinction. The genetically altered populations are managed to maintain or enhance their populations as well, although harvest of robust populations is acceptable

The reach of the Marias River above Tiber Reservoir includes both coldwater and warmwater species and becomes primarily a warmwater fishery near Tiber Reservoir (Lake Elwell) where walleye are the most abundant game fish. Coldwater game fish, including rainbow trout and mountain whitefish, also inhabit this reach, but in lower numbers. Northern pike, yellow perch, and burbot are other resident fish species of interest to many anglers. In addition, non-game fish present include common carp, flathead chub, lake chub, emerald shiner, fathead minnow, longnose dace, and Rocky Mountain sculpin, as well as mountain, white, and longnose suckers. Walleye use the upper Marias for spawning and a segment of the population remains in the river throughout the summer. Young-of-the-year walleye have been sampled during the summer,

indicating that the river also provides rearing habitat. Larger-sized rainbow trout are found in the river mainly in the spring and early summer. The upper Marias River has only a moderate fishery. Fishing pressure has averaged 1,602 angler days from 2001-2009.

Below Tiber Dam 21 miles downstream to Highway 223 (Circle Bridge), the coldwater releases from the dam have altered the aquatic environment to favor coldwater salmonid species. Mountain whitefish exist in high numbers and are the most abundant game fish in the reach. Rainbow and brown trout occur in fair numbers, exhibiting excellent growth rates. Warmwater game fish, including sauger, walleye, northern pike, and burbot also inhabit this reach, but in lower numbers. Fourteen species of non-game fish have been sampled in this reach, including goldeye, common carp, flathead chub, lake chub, emerald shiner, Western silvery minnow, fathead minnow, longnose dace, river carpsucker, shorthead redhorse, longnose sucker, white sucker, yellow perch, and Rocky Mountain sculpin. The reach has a good fishery primarily because of improved water management by the BOR, which maintained minimum instream flows. This tailwater fishery is the only trout stream within a 50-mile radius, and it receives a moderate amount of angler use. Because of limited natural reproduction, spawning is supplemented by stocking trout.

The reach of the Marias River from Highway 223 (Circle Bridge) 57 miles downstream to the mouth contains a warmwater fishery in which sauger are the most abundant resident game fish. Walleye occur in fair numbers and are more numerous in the lower portion of the reach. Channel catfish are found in moderate numbers throughout the lower Marias. Game fish that migrate from the Missouri River into the Marias to spawn are shovelnose sturgeon, sauger, walleye, and channel catfish. Shovelnose sturgeon have been sampled throughout this reach during their spawning period, late-May through June. A moderate population of mountain whitefish, and an occasional brown trout, are the coldwater game fish found throughout the lower river. Sizes of sauger and walleye are about average for Montana river populations. The sizes reported for shovelnose sturgeon are for only the adult spawning segment; however, the maximum sizes found here surpass most other records and underscore the value of this high quality population. Sixteen resident non-game fish species have been sampled in the lower Marias River, including goldeye, common carp, flathead chub, lake chub, emerald shiner, plains minnow, western silvery minnow, fathead minnow, longnose dace, river carpsucker, shorthead redhorse, longnose sucker, white sucker, mountain sucker, stonecat, and Rocky Mountain sculpin. Blue sucker, smallmouth buffalo, bigmouth buffalo, and freshwater drum are the migratory species found in the river during their spawning seasons, but they reside in the Missouri River during the rest of the year. This reach of the Marias, mostly the lower 6 miles, receives intensive angling pressure during the spring spawning season (April through mid-July). During the rest of the season, there is a moderate amount of angler use. The entire reach below Tiber Dam to the mouth averaged 3,495 angler days per year from 2001-2009.

Both Lake Frances and Tiber Reservoir support fisheries where anglers focus angling on walleye, yellow perch and northern pike. Fisheries monitoring is focused on these species and forage species in an effort to provide an adequate forage base for the top-level predators. While the Lake Frances fishery requires stocking biannually to maintain walleye numbers, Tiber Reservoir walleye have provided adequate recruitment through wild reproduction after stocking that occurred back in the early 1970s and again in 1986 and 1988. The frequency of stocking in Lake Frances is being evaluated in an effort to provide high walleye growth rates and a desirable

size structure. Angler use has average 12,313 angler days per year on Lake Frances and 17,878 angler days on Tiber Reservoir for the 27-year period from 1982-2009.

HABITAT

Long-term USGS flow records are available for the Marias River near Shelby (river mile 140.6) and below Tiber Dam near Chester (river mile 78.3). The mean annual flow near Shelby for a 108-year period of record (103 years of data) from 1903-2011 was 885 cfs; the peak flow was recorded in 1964 at 241,000 cfs and was associated with a dam failure in a flood year (1964). The mean annual flow below Tiber Dam for a 65-year interrupted period of record (58 years of data) between 1945-2011 was 800 cfs. Extreme flows since Tiber Dam was completed in 1955 have ranged from a low of nearly zero to a high of 10,400 cfs. A shorter period of record (13 years) for the Marias River near the mouth at Loma between 1960-72 showed a mean annual flow of 977 cfs, with a low of 45 cfs and a high of 10,800 cfs.

The largest user of water in the Marias Basin is irrigated agriculture. A total of 206,696 acre-feet or 34% of the average annual flow was consumed during 1980, a fairly typical year. Including Tiber Reservoir, four other reservoirs in the basin have storage capacities greater than 1,000 acre-feet. All except Tiber are used primarily for irrigation. These reservoirs have an estimated total storage capacity of 1,542,158 acre-feet.

Water temperatures downstream of Tiber are also affected by the operation of the dam. Deep cold water releases from the reservoir significantly reduced the river's summer temperatures at least 20 miles below the dam. The 7.5MW hydroelectric generating facility added to Tiber Dam in 2005 mitigates these temperature modifications to some extent.

FISHING ACCESS

Access to the 138 miles of river is generally limited to seven bridge crossings, including: the Loma Bridge FAS; BLM's Sullivan Bridge, Pugsley Bridge, and Moffat Bridge Recreation Areas; 2 miles of public river frontage, one immediately upstream from Tiber Reservoir and the other downstream from the dam; and FWP's Marias River Wildlife Management Area (WMA), a 5,845 acre parcel that includes 16.9 river miles between its upper and lower boundaries. The WMA is located between Sullivan Bridge Road and I-15 in the reach above Tiber Reservoir. Although the river is usually navigable, the distances between bridges in the upper river and most portions of the lower river generally require more than a day's travel and are becoming a more popular recreational float. Many reaches of the Marias River receive only light fishing pressure primarily due to its remote and relatively inaccessible location. Most of the private landowners allow access with permission; however, the terrain bordering the river is fairly rugged making physical access difficult.

SPECIAL MANAGEMENT ISSUES

FWP continues to cooperate with the Blackfoot Fish and Wildlife Department on fisheries issues, particularly projects involving native westslope cutthroat trout on streams that traverse both reservation and adjacent public lands.

FWP will also continue to provide technical advice and work with the BOR to manage flows downstream from Tiber Dam to maintain a more natural hydrograph designed to benefit the

native fish assemblage and migratory fishes in the Marias below the dam and in the Middle Missouri River downstream of the Marias River.

FISHERIES MANAGEMENT DIRECTION FOR THE MARIAS RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
So. Fork Two Medicine River – Headwaters to Blackfeet Reservation Boundary	15.5 miles	Rainbow trout	Wild	Special Regulations	Manage as recreational fishery with consumptive harvest. Promote harvest.
		Westslope cutthroat trout hybrids	Wild	Conservation	Maintain population to reduce extinction risk. Manage to prevent additional hybridization.
		Mountain whitefish	Wild	General	Maintain population within historic levels.
Habitat needs and activities: Maintain habitat and instream flows of 16 cfs. Evaluate sites for a major barrier.					
Birch Creek – Swift Reservoir to Highway 358	43 miles	Brook Trout	Wild	General	Maintain a recreational fishery with consumptive harvest.
Habitat needs and activities: Maintain habitat and instream flows of 64 cfs.					
South Fork Dupuyer Creek	8.8 miles	Brook trout	Wild	General	Manage as recreational fishery with consumptive harvest.
		Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk.
Habitat needs and activities: Maintain habitat and instream flows of 6 cfs.					
North Fork Dupuyer Creek	10.5 miles	Brook trout	Wild	General	Manage as recreational fishery with consumptive harvest.
		Westslope cutthroat trout	Wild	Conservation	Maintain or enhance population to reduce extinction risk. Monitor to ensure hybrids do not ascend barrier at high magnitude flows.
Habitat needs and activities: Maintain habitat and instream flows of 12 cfs. Evaluate possible modification of barrier to maintain isolation at all flows.					
Dupuyer Creek	37.4 miles	Brook trout, Rainbow trout	Wild	General	Manage as recreational fishery with consumptive harvest.
		Mountain whitefish	Wild	General	Maintain population within historic levels.
Habitat needs and activities: Maintain habitat and instream flows of 12 cfs.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
South Badger Creek	10.9 miles	Brook trout, Rainbow trout	Wild	General	Manage as recreational fishery with consumptive harvest. Prevent competition or hybridization with WCT.
		Westslope cutthroat trout	Wild	Conservation	Maintain population to reduce extinction risk. Monitor to ensure non-natives do not ascend barrier at high magnitude flows.
Habitat needs and activities: Maintain habitat and instream flows of 40 cfs.					
North Badger Creek	20 miles	Westslope cutthroat trout	Wild	Conservation	Maintain population to reduce extinction risk. Monitor to ensure non-natives are not illegally introduced.
Habitat needs and activities: Maintain habitat and instream flows of 14 cfs.					
Badger Creek- from Confluence of North and South Badger Creeks to Blackfeet Reservation Boundary	6.5 miles	Brook trout, Rainbow trout, Westslope cutthroat trout hybrids	Wild	Special Regulations	Manage as recreational fishery with consumptive harvest.
Habitat needs and activities: Maintain habitat and instream flows of 60 cfs.					
Cut Bank Creek – From the Blackfeet Reservation Boundary to the Mouth	19 miles	Rainbow trout, Brown trout	Wild	General	Manage as recreational fishery with consumptive harvest.
		Mountain whitefish, Burbot	Wild	General	Maintain population within historic levels.
Habitat needs and activities: Maintain habitat and instream flows of 75 cfs.					
Brook trout Streams in Two Medicine River Basin	240 miles	Brook trout	Wild	General	Manage for a consumptive harvest.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Swift Reservoir	450 acres	Rainbow trout	Wild	General	Marginal fishery with low fishing pressure and split jurisdiction with the Blackfeet Reservation. Maintain wild population for a recreational fishery with some consumptive harvest.
Marias River – Confluence of Two Medicine River & Cutbank Creek to the Headwaters of Tiber Reservoir	60 miles	Rainbow trout, Northern pike	Wild	General	Maintain a recreational fishery for consumptive harvest.
		Mountain whitefish	Wild	Special regulations	Maintain populations within historic levels.
		Burbot	Wild	General	Maintain populations within historic levels.
		Walleye	Wild	General	Maintain a recreational fishery for consumptive harvest and maintain access for adfluvial spawning populations within historic levels.
		Yellow perch	Wild	General	Maintain populations within historic levels with some consumptive harvest.
Habitat needs and activities: Maintain habitat and instream flows of 200 cfs.					
Tiber Reservoir (Lake Elwell)	14,842 acres	Walleye	Wild	General	Manage for a consumptive harvest with an opportunity for a trophy fish. Rely upon natural reproduction for recruitment.
		Yellow Perch	Wild	General	Maintain population within historic levels and provide a major component of the forage base and contribute to recreational fishery.
		Cisco	Wild	General	Maintain population within historic levels and provide a major component of the forage base for large predatory species in Tiber.
		Lake trout	Wild	General	Manage for a consumptive harvest.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

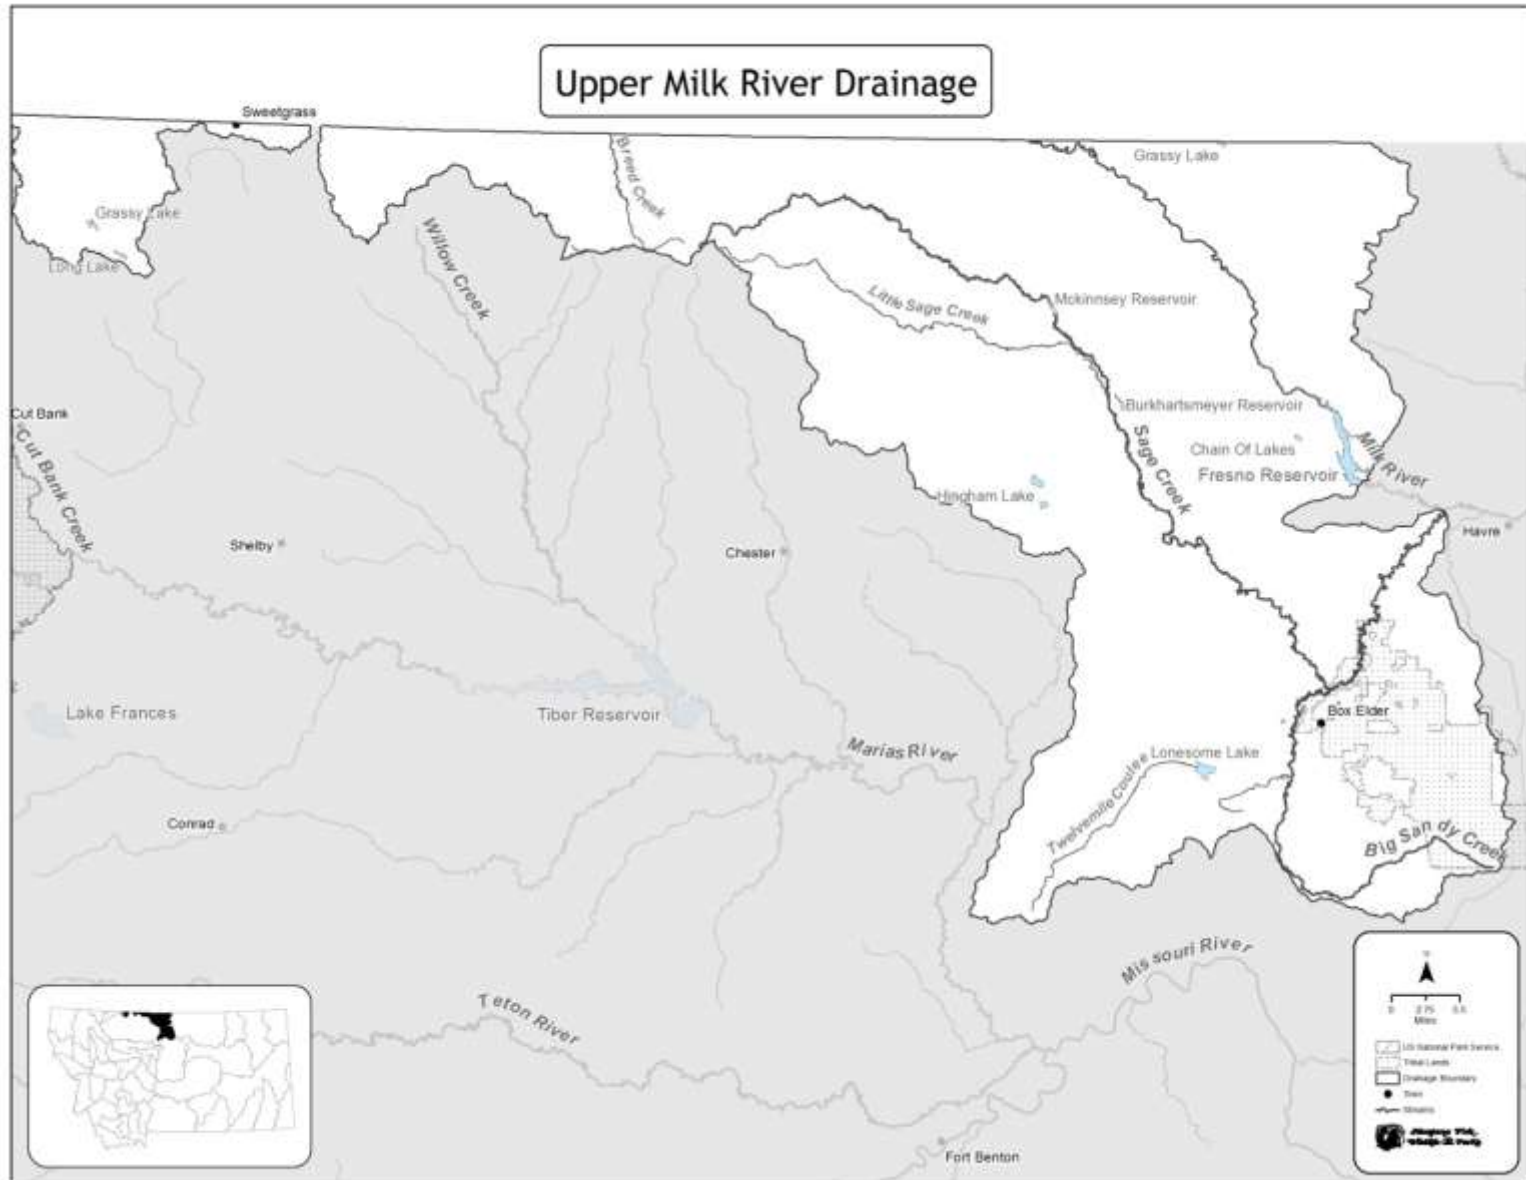

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Northern pike	Wild	General	Manage for a consumptive harvest with the potential for a trophy fish.
		Burbot	Wild	General	Manage for a consumptive harvest.
		Rainbow trout	Wild	General	Manage as an occasional species available for a consumptive harvest.
		Shovelnose sturgeon	Wild	General	Maintain existing small population present. Consider potential for reestablishing a larger population.
Marias River – Tiber Dam to Highway 223 (Circle Bridge)	21 miles	Brown trout, Rainbow trout	Wild/ Hatchery	General	Maintain a recreational fishery with some consumptive harvest.
		Mountain whitefish	Wild	Special Regulations	Maintain population within historic levels.
		Burbot, Walleye, Northern pike	Wild	General	Maintain population within historic levels.
Habitat needs and activities: Maintain habitat and instream flows of 500 cfs.					
Lake Frances	3,618 acres	Walleye	Hatchery/ Wild	General	Manage for a consumptive harvest. Evaluate contribution of walleye plants on a biannual basis.
		Northern pike, Burbot	Wild	General	Manage for a consumptive harvest.
		Yellow perch	Wild	General	Maintain population within historic levels to provide a major component of the forage base and contribute to recreational fishery. Prohibit as a species in any fishing contest to optimize forage reproductive potential.
		Rainbow trout	Wild	General	Manage as an occasional species available for a consumptive harvest.
Habitat needs and activities: Manage forage base using the forage species currently present.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Marias River – Highway 223 (Circle Bridge) to Mouth	57 miles	Sauger	Wild	Special Regulations	Maintain and enhance the population while maintaining a recreational fishery with some consumptive harvest.
		Mountain whitefish	Wild	Special Regulations	Maintain population within historic levels.
		Shovelnose sturgeon	Wild	General	Maintain spawning run population within historic levels.
		Walleye, Channel catfish Burbot, Brown trout	Wild	General	Maintain population within historic levels.
		Smallmouth bass	Wild	General	Maintain existing population levels if no observed impacts to native species.
Habitat needs and activities: Maintain habitat and instream flows of 560 cfs.					
Westslope Cutthroat Trout Genetically Unaltered Conservation Population Streams (Isolated Single Species Populations) (12 Streams)	41 miles	Westslope cutthroat trout	Wild	Conservation	Maintain or enhance populations to reduce extinction risk.
Habitat needs and activities: Maintain or improve habitat and explore suitable sites for barriers or reducing fragmentation of WCT occupied habitat.					
Westslope Cutthroat Trout Genetically Altered Conservation	32.9 miles	Westslope cutthroat trout & hybrids (Mixed populations)	Wild	Conservation	Maintain or enhance populations. Allow harvest in robust populations.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Population Streams (11 Streams)					
Habitat needs and activities: Manage forage base using the forage species currently present.					

UPPER MILK RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Upper Milk River flows approximately 105 miles through Alberta before re-entering Montana in Hill County, approximately 34 miles upstream of the Fresno Reservoir headwaters. This section of the Milk River consists of badlands, native grasses, sagebrush, and shrub/forest landscapes located primarily on federal lands. The Upper Milk area encompasses approximately 2,100 square miles. Sage Creek is one of two major tributaries to the Milk River, flowing from the headwaters near the Sweetgrass Hills and coursing through Liberty and Hill counties approximately 60 miles southeast to the junction with Big Sandy Creek. Stream-side vegetation consists mainly of native grasses, rose, and sagebrush. Surrounding lands are privately owned pasture and cultivated croplands. Big Sandy Creek begins in the Bear Paw Mountains and flows approximately 52 miles northeast through Choteau and Hill counties to its confluence with the Milk River downstream of Fresno Reservoir. Surrounding lands consist of timbered mountains, prairie pastures, and cultivated croplands located on private lands and the Rocky Boy Indian Reservation.

There are numerous reservoirs constructed on ephemeral streams located throughout this area. Most of these reservoirs are too shallow for fisheries and are primarily used for stock water and irrigation. The largest reservoirs are Fresno and Bailey, both of which receive high fishing pressure and other recreational use. Fresno is managed as an irrigation storage facility by the BOR and experiences considerable annual water level drawdowns.

FISHERIES MANAGEMENT

Fresno Reservoir is managed primarily for walleye. Management efforts are focused on working with the BOR on water-level management that benefits the resident fish community during critical spawning and rearing periods. Fresno Reservoir and the Milk River upstream of Fresno Dam supports a number of fish species including, walleye, yellow perch, lake whitefish, northern pike, black crappie, burbot, sauger, rainbow trout, stonecat, white sucker, longnose sucker, emerald shiner, spottail shiner, Rocky Mountain sculpin, fathead minnow, brook stickleback, lake chub, northern redbelly dace, longnose dace, western silvery minnow, and western silvery/plains minnow. Many of these species are also found in Sage and Big Sandy creeks. Species such as black bullhead, bluegill, smallmouth bass, largemouth bass, Iowa darter, and brassy minnow are found in the smaller impoundments and tributaries. Brook trout are found in the headwaters of Big Sandy Creek.

Fresno Reservoir has been stocked with 100,000 walleye fingerlings annually with little consideration given to wild walleye production, forage fish abundance and habitat quantity and quality. Stocking frequency and the number of walleye fingerlings planted are now being evaluated with the goal of improving walleye growth rates and size structure, while maintaining a favorable forage base. The forage base (yellow perch, black crappie, and spottail shiner) will be closely monitored with regard to current spawning success, water conditions, and predator densities.

Smaller reservoirs located throughout the area are managed for warm and cool water species diversity. Trapping and transport of warm-water species such as yellow perch, bluegill, black crappie, and fathead minnows will be implemented to establish new fisheries, promote kids fishing, and establish forage fish populations or to supplement existing game fish populations. Hatchery-reared rainbow trout, brook trout, and largemouth bass will continue to be stocked into those ponds with sufficient water depth and good overwinter survival. Ponds and reservoirs will be re-stocked immediately following severe drought events or winterkills if favorable habitat conditions exist. Windmill aeration systems will be maintained on those ponds with marginal depths and low winter dissolved oxygen levels.

Very little information has been obtained identifying species composition, densities, specific interactions, and habitat use of native and non-native fishes within the Milk River above Fresno Reservoir. Therefore, development and implementation of a standardized sampling program targeting multiple habitats is currently being developed.

Angling opportunities occur year-round, with anglers targeting the rivers and streams during the spring, shifting to the ponds and reservoirs from late spring through the winter months. Shore, boat, and ice fishing opportunities exist throughout the area, with anglers using a variety of methods to catch multiple species. Anglers need to be aware of the no live bait fish restriction on Fresno Reservoir and the Milk River above Fresno Reservoir.

HABITAT

Flows on the Upper Milk River are highly variable and can range from intermittent pools (no flow) to flows exceeding 5,000 cfs depending on the time of year and precipitation. Flows are augmented annually through the transbasin diversion from the St. Mary River and canal system with up to 650 cfs during the irrigation season (April-September). Fresno Reservoir is a mainstem irrigation storage facility located on the Milk River with annual water fluctuations of more than 21 feet. Extreme reservoir drawdowns have negative impacts to the fishery and can result in poor spawning conditions, poor rearing habitat, poor overwinter water conditions, and increased fish entrainment downstream. Although uncommon, there have been years in which recreationists were unable to launch boats due to low reservoir water conditions.

Fish passage issues exist in the Upper Milk drainage, but little work has been done to identify these and determine passage enhancement opportunities. Plans are being developed to identify areas of impaired passage and implement safe water crossings which emphasize fish passage and habitat connectivity. Recommending best management practices for improving bank stabilization and riparian habitats, while opposing land use activities that further degrade habitat and water quality will be emphasized.

Riparian habitats associated with smaller reservoirs vary depending on rotational grazing plans and fencing. Water quality varies as well based on surrounding land use practices, water depth, and seasonal climate variables. Efforts are underway to work with land management agencies and private landowners to improve riparian health through a variety of treatments.

FISHING ACCESS

The Upper Milk River is surrounded by federal lands, but access to those lands is limited. One access site is off a county road approximately 10 miles upstream of the Fresno Reservoir

headwaters. Access to Fresno Reservoir is good (primarily BOR ownership), with campgrounds provided and managed by the Fresno Chapter of Walleyes Unlimited, and primitive camping available throughout the lower half of the reservoir. There are two concrete boat ramps located near the dam and in Kremlin Bay.

Bailey Reservoir, a popular youth fishery and important regional fishery is the only State Fishing Access Site located in this area. Amenities at Bailey Reservoir include a fishing pier, pavilion, and boat ramp.

The FWP Region 6 pond guide will continue to be updated and distributed to anglers to increase awareness on local pond opportunities. Access and opportunity will continue to be a major emphasis throughout the area.

SPECIAL MANAGEMENT ISSUES

Fishing Tournaments

Currently, one open water walleye tournament and one ice fishing tournament are held on Fresno Reservoir annually. Tournament dates must be finalized with the BOR prior to completion of the permit application issued by MFWP. Tournaments will be reviewed on an individual basis. Evaluation of proposed tournaments will include potential biological and social impacts. Each tournament undergoes a 30-day public review and comment period. Tournament directors will be required to report post-tournament catch-rate information in a standardized format.

Milk River and Fresno Reservoir Water Management

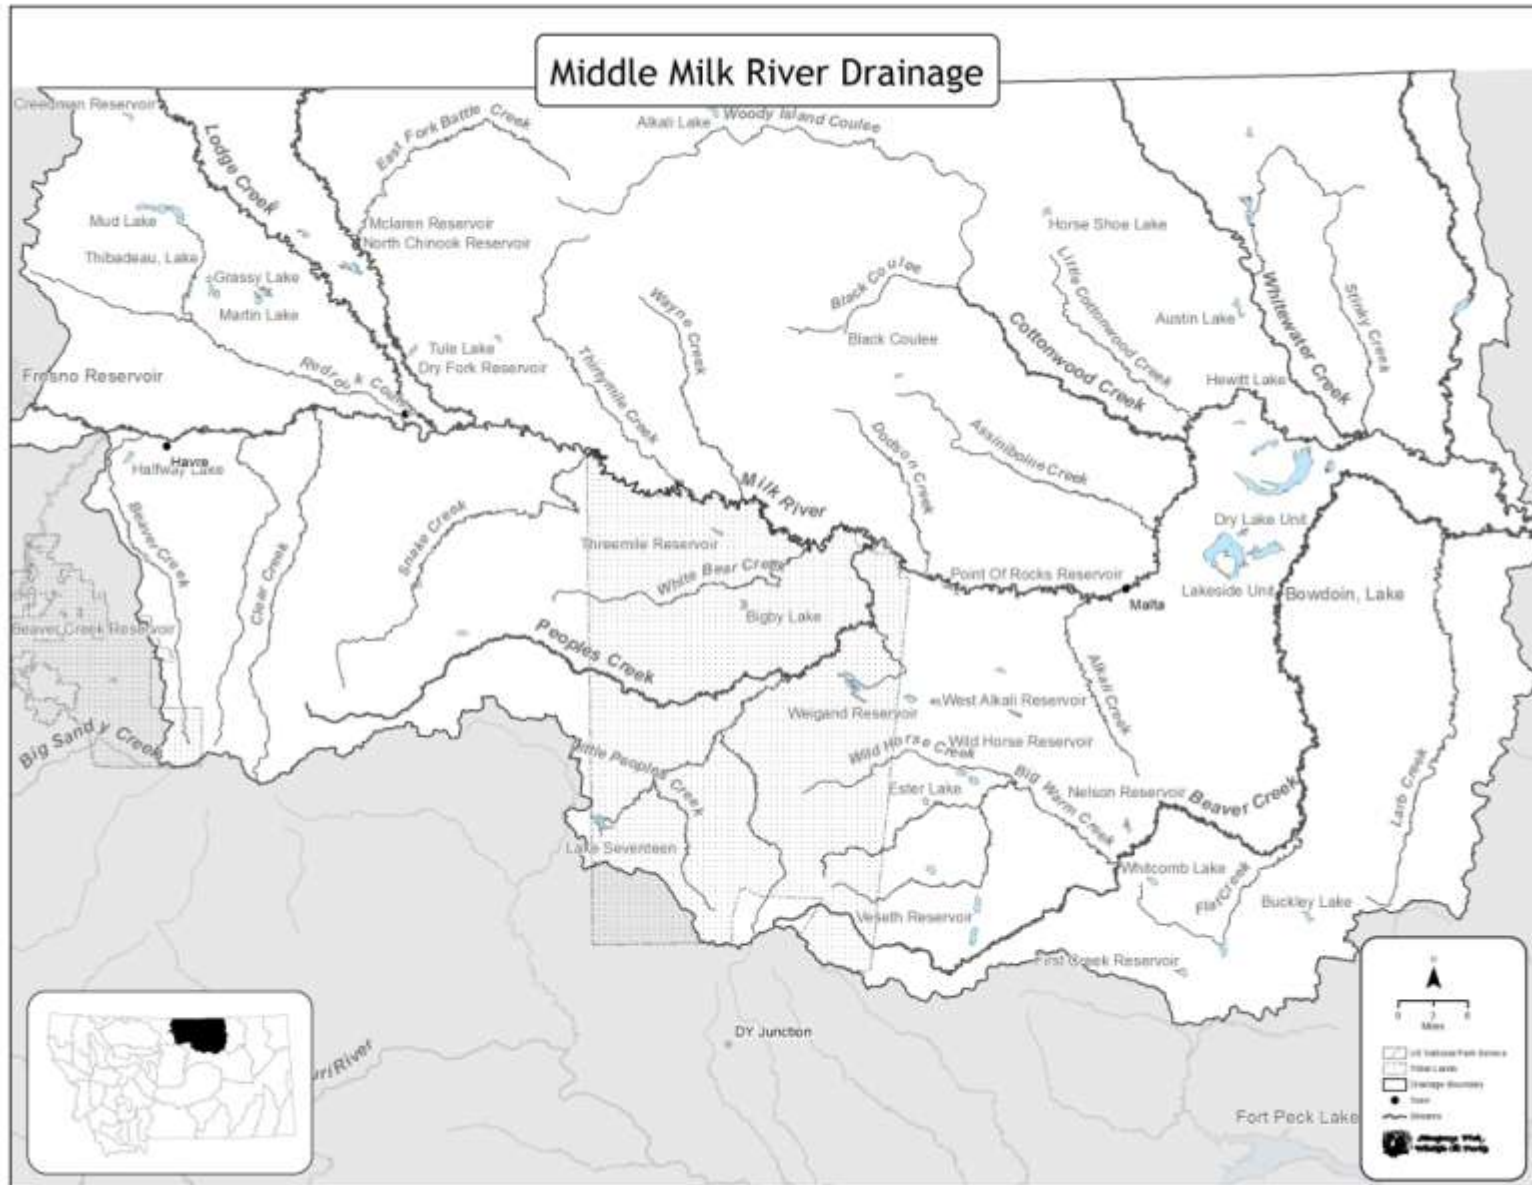

The St. Mary canal and existing infrastructure is approaching 100 years of age and is in need of major repairs. The St. Mary's Working Group is working on a plan to update and repair the existing infrastructure to ensure supplemental water continues to provide irrigation water to agricultural producers throughout the Milk River watershed. The BOR recently completed a transbasin water analysis study that identified potential climate change related impacts to the watershed. Anticipated impacts include highly variable water supplies that have the potential to limit all water uses over the next 40-year time period.

FISHERIES MANAGEMENT DIRECTION FOR UPPER MILK RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Milk River - Canadian border to Fresno Reservoir headwaters	34 miles	Walleye, Northern pike	Wild	General	Develop and implement a standardized sampling program.
		Sauger Burbot	Wild	General/Conservation	Develop and implement a standardized sampling program. Work with Alberta Sustainable Resource Development to collect sauger genetics in the upper Milk River.
		Native non-game fishes	Wild	Conservation	Develop and implement a standardized sampling program.
Habitat needs and activities: Identify current and historic habitat limitations as it pertains to winter flows, fish production, and rearing habitat. Work with the BOR, the local conservation district, and landowners to address any habitat issue identified.					
Fresno Reservoir	5,700 acres	Walleye, Northern pike, Yellow perch, Black crappie, Lake whitefish	Wild/Hatchery	General/Put-Grow-Take	Continue to evaluate and manage the fish community in regards to reservoir water management. Implement walleye and yellow perch stocking strategies based on water management and current population densities.
		Sauger, Burbot	Wild	General/Conservation	Monitor populations to detect changes in species composition and abundance.
Habitat needs and activities: Work with Bureau of Reclamation and water users to optimize water management in Fresno Reservoir to benefit the resident fisheries. Optimal water management should target steady to rising reservoir water levels during critical spawning periods (mid April-mid June). It should also target favorable overwinter pool elevations that submerge rock substrates and increase young of year rearing habitat.					
Big Sandy Creek	52 miles	Walleye, Northern pike, Yellow perch, Black bullhead	Wild	General	Begin to understand fish assemblage and population size of game fishes.
		Native non-game fishes	Wild	Conservation	Protect habitat and provide passage where applicable.
Habitat needs and activities: Identify habitat issues and work closely with local conservation districts, county road crews, and landowners to implement safe water crossings which emphasis fish passage and water connectivity.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Sage Creek	60 miles	Northern pike, Yellow perch	Wild	General	Begin to understand fish assemblage and population size of game fishes.
		Native non-game fishes	Wild	Conservation	Protect habitat and provide passage where applicable.
Habitat needs and activities: Identify habitat issues and work closely with local conservation districts, county road crews, and landowners to implement safe water crossings which emphasis fish passage and water connectivity.					
Bailey Reservoir	70 acres	Northern pike, Yellow perch, Black crappie	Wild	General	
		Walleye	Hatchery	Put-Grow-Take	Stock 10,000 walleye fingerlings on alternate years.
Habitat needs and activities: Seek opportunities to increase reservoir habitat with use of artificial structures.					

MIDDLE MILK RIVER DRAINAGE

PHYSICAL DESCRIPTION

This drainage is located in north central Montana in Hill, Blaine, and Phillips counties and encompasses approximately 8,700 square miles. The landscape is diverse with cottonwood galleries and irrigated crop and hay lands along the Milk River and major tributaries, dry-land agriculture and rangeland throughout the area, and two island mountain ranges (Bear Paws and Little Rockies). Landownership in this area consists of federal, state, and private lands, including the Fort Belknap Reservation and a portion of the Rocky Boy Reservation. In this drainage, the Milk River flows for 302 miles from Fresno Reservoir downstream to Hinsdale. There are several major tributaries to the Milk River located in this reach. Lodge, Battle, and Frenchman Creeks all originate in Alberta and Saskatchewan, Canada; whereas Beaver (Hill), Clear, Peoples, and Little Boxelder Creeks originate in the Bear Paw Mountains and Beaver Creek (Phillips) originates in the Little Rocky Mountains.

There are numerous reservoirs located throughout this area. Most of these reservoirs are generally too shallow to support perennial fisheries and are primarily used for stock and irrigation. The largest reservoirs by surface acreage are Nelson, Dry Fork, Beaver Creek, Anita, and Ester Reservoirs which receive high numbers of visitors for fishing and other recreational activities. Nelson Reservoir is managed as an irrigation storage facility by the BOR and can experience considerable drawdowns during prolonged drought cycles.

FISHERIES MANAGEMENT

This area is home to a number of fish species including, walleye, yellow perch, northern pike, black crappie, burbot, sauger, lake whitefish, goldeye, shorthead redhorse, smallmouth buffalo, bigmouth buffalo, black bullhead, bluegill, pumpkinseed, green sunfish, smallmouth bass, channel catfish, largemouth bass, Iowa darter, brassy minnow, stonecat, white sucker, longnose sucker, common carp, emerald shiner, spottail shiner, fathead minnow, brook stickleback, lake chub, northern redbelly dace, longnose dace, western silvery minnow, and western silvery/plains minnow. Species such as rainbow trout, brown trout, brook trout, and mountain sucker are found in the headwaters of Clear Creek and Beaver Creek. Brook trout are also found in some of the headwater streams located in the Little Rockies.

Nelson Reservoir is managed primarily for walleye but also contains a good northern pike and yellow perch population. This reservoir will continue to be managed as a multi-species fishery with an emphasis on walleye management that promotes healthy walleye growth and adult densities.

Very little information has been obtained identifying the species composition, densities, interactions, and habitat use of native and non-native fishes within the Middle Milk River. Therefore, development and implementation of a standardized sampling program targeting multiple habitats with maximum efficiency will aid in addressing some of these questions.

Smaller reservoirs located throughout the area are managed for diversity and monitored every one to five years, based on angler use. Trap and transport of warm-water species such as yellow

perch, bluegill, black crappie, and fathead minnows is used to establish new fisheries, promote kids fishing, establish a forage base, or to supplement existing populations. Hatchery reared rainbow trout and largemouth bass are stocked into those ponds that have traditionally received them and exhibit good overwinter water conditions. Ponds and reservoirs will be re-stocked following severe drought events or winterkills. Windmill aeration systems are maintained on those ponds with marginal depths and low winter dissolved oxygen levels.

Angling opportunities occur year-round with anglers typically targeting the rivers and streams during the spring, and shifting to ponds and reservoirs from late spring through winter. Shore, boat, and ice fishing opportunities exist throughout the area with anglers using a variety of methods to catch multiple species.

HABITAT

The Middle Milk is one of the most impacted sections of river in Montana. There are eight in-stream dams/diversions used to divert water for irrigation and municipal use that are barriers to fish passage. Fish passage issues also exist in the larger tributaries as with a dam located on Frenchman Creek (Frenchman Dam). There are plans to identify those areas that restrict fish passage and promote stream crossing designs that provide aquatic connectivity. Implementing best management practices for improving bank stabilization and riparian habitats while opposing land use activities that further degrade habitat and water quality is emphasized as a general management strategy.

Nelson Reservoir is an off-stream storage facility that draws water from the Milk River and has water levels that are relatively stable, except during extreme drought, compared to other reservoirs within the area. Ensuring stable or rising reservoir levels during critical spawning and rearing periods allows this fishery to maintain balanced predator-prey densities and good growth rates.

Riparian habitats associated with smaller reservoirs vary depending on current rotational grazing plans and fencing. Water quality also varies based on surrounding land practices, depth, and seasonal climate. Working with federal agencies (e.g., BLM) to implement riparian fencing and off-site watering projects for livestock improves riparian habitats and increases the aesthetic values surrounding these small reservoirs.

FISHING ACCESS

Public access to the Middle Milk River is limited due to the predominance of private land along the river. There are three FWP Fishing Access Sites (Fresno Tailwater, Alkali Creek, and Bjornberg Bridge) and a number of bridges that anglers can use to access the Milk River and streams located throughout the area. Access to Nelson Reservoir is good with much of the adjacent land owned and managed by the BOR. Camping areas and two concrete boat ramps are located near the dam and east shoreline of the reservoir. There are also FASs located at Bear Paw Lake, Cole Ponds, and Faber Reservoir, giving anglers a diverse fishing opportunity on some smaller bodies of water. Local pond opportunities on state, federal, and private lands is also available throughout the area, and information can be found in the Region 6 pond guide. Access and opportunity will continue to be a major emphasis throughout the area.

SPECIAL MANAGEMENT ISSUES

Fishing Tournaments

Currently, one ice fishing tournament are held on Nelson Reservoir annually. Tournament dates must be finalized with the BOR prior to completion of the permit application issued by MFWP. Tournaments will be reviewed on an individual basis. Evaluation of proposed tournaments will include potential biological and social impacts. Each tournament undergoes a 30-day public review and comment period. Tournament directors will be required to report post-tournament catch-rate information in a standardized format.

Milk River and Nelson Reservoir Water Management

The St. Mary canal and existing infrastructure is approaching 100 years of age and is in need of major repairs. The St. Mary's Working Group is working on a plan to update and repair the existing infrastructure to ensure supplemental water continues to provide irrigation water to agricultural producers throughout the Milk River watershed. The BOR recently completed a transbasin water analysis study that identified potential climate change related impacts to the watershed. Anticipated impacts include highly variable water supplies that have the potential to limit all water uses over the next 40 year time period.

FISHERIES MANAGEMENT DIRECTION FOR MIDDLE MILK RIVER DRAINAGE

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Milk River - Fresno Reservoir tailwaters to Hinsdale	302 miles	Walleye, Northern pike, Yellow perch, Black crappie, Lake whitefish, Sauger, Channel catfish, Burbot	Wild	General	Develop and implement a standardized sampling program to monitor sport fish populations. Better understand entrainment losses of all fishes through diversion canals and intake structures.
		Native non-game fishes	Wild	Conservation	Monitor populations to detect changes in species composition and abundance.
		Rainbow trout	Hatchery	Put-Grow-Take	Continue to stock 4,000 rainbow trout into the Fresno Tailwaters annually.
Habitat needs and activities: Work with local, state, and federal agencies along with landowners to implement best management practices that improve or maintain natural riverine habitats.					
Beaver Creek Section 03 and 04- Bear Paw Lake headwaters to East Fork Dam tailwaters	12 miles	Brook trout, Rainbow trout	Wild	General	Manage for self sustaining brook trout fishery. Develop and implement a standardized sampling program to understand fish assemblage and population size.
Habitat needs and activities: Work with Beaver Creek County Park to implement best management practices that improve or maintain natural riverine and riparian habitats.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Beaver Creek Section 02- Beaver Creek Reservoir headwaters to Bear Paw Lake tailwaters.	8 miles	Brown trout	Hatchery	Put-Grow-Take	Stock 2,000 brown trout annually for put and take trout fishery.
		Rainbow trout, Brook trout, Walleye, Northern pike, Yellow perch, Smallmouth bass	Wild	General	Develop and implement a standardized sampling program to understand fish assemblage and population size.
Habitat needs and activities: Work with Beaver Creek County Parks to implement best management practices that improve or maintain natural riverine and riparian habitats.					
Bear Paw Lake	45 acres	Rainbow trout	Hatchery	Put-Grow-Take	Stock 20,000 rainbow trout annually for put and take trout fishery.
		Brook trout, Smallmouth bass	Wild/Hatchery	General/Special Regulations	Consider increasing daily combined trout limit from 3 to 5 fish. Manage for self-sustaining smallmouth bass population.
		Walleye	Hatchery	Put-Grow-Take	Stock walleye fingerlings as biological control of white sucker on an as-needed basis.
Beaver Creek Section 01- Confluence of Milk River to Beaver Creek Reservoir tailwaters.	22 miles	Brown trout	Hatchery	Put-Grow-Take	Stock 3,000 brown trout annually for put and take trout fishery.
		Rainbow trout, Brook trout, Walleye, Northern Pike, Yellow Perch, Smallmouth bass	Wild	General	Develop and implement a standardized sampling program to understand fish assemblage and population size.
Habitat needs and activities: Work with local, state, and federal agencies along with landowners to implement best management practices that improve or maintain natural riverine habitats.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Beaver Creek Reservoir	160 acres	Rainbow trout, Walleye	Hatchery	Put-Grow-Take	Stock 50,000 rainbow trout annually for put and take trout fishery. Consider increasing daily combined trout limit from 3 to 5 fish. Evaluate current walleye stocking programs success. Implement a walleye stocking strategy that optimizes stocked walleye recruitment and relative abundance while maintain a good forage base.
		Northern pike, Yellow perch, Smallmouth bass, Brook trout	Wild	General	Continue to monitor these populations as well as evaluate the biological and social impacts regarding a black crappie introduction into the reservoir.
Habitat needs and activities: MFWP has requested that reservoir water levels remain stable to slightly increasing during the spring spawning period (April-May).					
Clear Creek	40 miles	Walleye, Northern pike, Yellow perch, Sauger	Wild	General	Better understand fish assemblage and population size of game fishes.
		Native non-game fishes	Wild	Conservation	Protect habitat and provide passage where applicable.
		Brook trout	Wild	General	Manage for self-sustaining brook trout fishery.
Habitat needs and activities: Identify habitat issues and work closely with local conservation districts, county road crews, and landowners to implement safe water crossings which emphasis fish passage and water connectivity.					
Lodge Creek, Battle Creek	62 miles, 70 miles	Walleye, Northern pike, Black bullhead, Sauger, Yellow Perch	Wild	General	Better understand fish assemblage and population size of game fishes.
		Native non-game fishes	Wild	Conservation	Protect habitat and provide passage where applicable.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Habitat needs and activities: Identify habitat issues and work closely with local conservation districts, county road crews, and landowners to install safe water crossings which emphasize fish passage and water connectivity.					
Peoples Creek	70 miles	Walleye, Northern pike, Black bullhead, Yellow perch	Wild	General	Better understand fish assemblage and population size of game fishes.
		Native non-game fishes	Wild	Conservation	Protect habitat and provide passage where applicable.
		Brook trout	Wild	General	Manage for self-sustaining brook trout fishery.
Habitat needs and activities: Identify habitat issues and work closely with local conservation districts, county road crews, and landowners to implement safe water crossings which emphasis fish passage and water connectivity.					
Dry Fork Reservoir	350 acres	Walleye	Hatchery	Put-Grow-Take	Stock 10,000 walleye fingerlings annually.
		Northern pike, Yellow perch, Black crappie	Wild	General	Maintain a quality fishing experience for all species. Continue to monitor the population.
Habitat needs and activities: Look to minimize irrigation impacts on pool elevations.					
Ross Reservoir	6 acres	Yellowstone cutthroat trout	Hatchery	Put-Grow-Take	Maintain current harvest opportunity
Faber Reservoir	38 acres	Rainbow trout	Hathcery	Put-Grow-Take	Manage for put and take rainbow trout fishery. Get feedback from anglers on possibly introducing black crappie.
Brookie Pond	4 acres	Brook trout	Hatchery	Put-Grow-Take	Maintain current harvest opportunity
Habitat needs and activities: Maintain windmill aerator.					
Frenchman Creek	78 miles	Walleye, Northern pike, Black bullhead, Yellow perch	Wild	General	Better understand fish assemblage and population size of game fishes.
		Native non-game fishes	Wild	Conservation	Protect habitat and provide passage where applicable.

Warm water Reservoirs and Ponds- Located throughout Hill, Blaine, and Phillips Counties	Various	Largemouth bass, Northern pike, Walleye, Smallmouth bass, Channel catfish, Black crappie, Yellow perch, Bluegill	Wild/Hatchery/ Transfer	General/ Put-Grow-Take	Manage as self-sustaining fisheries. Supplement populations with hatchery stocking and wild fish transfers as needed. Monitor water conditions and impacts from winterkill.
Habitat needs and activities: Work with Bureau of Land Management and landowners to increase riparian habitats and aesthetic landscapes surrounding the ponds. Maintain windmill aeration systems on ponds with marginal depths.					

LOWER MILK RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Lower Milk River drainage covers approximately 2,644 square miles, including the Milk River from Hinsdale downstream to its confluence with the Missouri River. The vast majority of the district is situated within Valley County, with the exception of the northwest most portion which lies within Phillips County. Significant tributaries include Rock Creek from the north and Willow creek from the south. Although the Milk River bottoms are mostly in private ownership, areas to the north and south include large tracks of BLM land as well as private lands. Along the Milk River irrigated croplands dominate the landscape with intact cottonwood galleries intermixed throughout. The areas to the north are a mix of dry land grain farming and native grass communities. Areas to the south also have dry land grain farming and native sagebrush habitats.

FISHERIES MANAGEMENT

The Milk River from Hinsdale to Vandalia Dam is greatly influenced by the complete fish barrier that Vandalia Dam has created. The richness of native fishes is greatly reduced when compared to sections downstream of Vandalia (Missouri River influence). One native species (channel catfish) and two introduced species (walleye and northern pike) dominate the fishery in this section. Other introduced game fishes including yellow perch, black crappie, bluegill and smallmouth bass are also found in this section. Although not considered a lake or a reservoir, Vandalia Dam backs water up to Hinsdale and boat fishing and water-based recreation is popular.

The fish populations of the Milk River downstream of Vandalia Dam are interconnected to the Missouri River, with high native and nonnative species richness. The abundance of both native and introduced fish can greatly vary on a seasonal or yearly basis depending on the river's discharge and the number of fish migrating upstream from the Missouri River. Game fish that occur in this section include channel catfish, sauger, walleye, shovelnose sturgeon, northern pike, burbot, lake whitefish, smallmouth bass and paddlefish. Non-game fish include (but are likely not limited to) pallid sturgeon, bigmouth and smallmouth buffalo, river carpsucker, blue sucker, white and longnose sucker, shorthead redhorse, freshwater drum, goldeye, stonecat, black bullhead, flathead chub, sicklefin chub, sturgeon chub, sand shiner, emerald shiner, spottail shiner, fathead minnow, brassy minnow, western silvery minnow, plains minnow and common carp.

The lower Milk River is a very important tributary to the Missouri River for fish recruitment. Studies have found that when the Milk River is flowing during the spring and early summer, countless fish of several species are produced and drift into the Missouri River. Paddlefish production in the lower Milk River occurs in years that the Milk has spring and early summer flows. In addition, blue suckers are known to enter the Milk River when flows are near 1,000 cfs and spawn, while in years where relatively little flow occurs blue suckers don't even enter the river. Furthermore, higher flows are required to scour silt from the bottom of the river into suspension and expose the many gravel bars--allowing fish like sauger and paddlefish to attach

their eggs. The importance of the Milk River is just becoming known and with the recent migrations of pallid sturgeon into the river, further study is warranted.

Fishing regulations in the lower Milk River are similar to that of the rest of the Eastern District, with the exception of paddlefish. Although paddlefish use the lower Milk in the spring and early summer, no fishing is allowed. This is because the size of the population and the amount of fishing pressure it can withstand is not fully understood. Furthermore, there is very limited public access on this portion of the river and spawning is sporadic and dependent on river discharge. Limited access not only makes fishing difficult, but limits effective law enforcement.

Rock Creek is a relatively large tributary that enters the Milk River northwest of Saco. Although the majority of angling likely occurs at its confluence with the Milk River Rock Creek it has at least 14 species within the drainage, 12 of which are native species.

Several prairie ponds that provide public access are stocked with game fishes to provide fishing opportunities. The deeper ponds have been stocked with game fish that are meant to be self-sustaining, such as northern pike, yellow perch, white or black crappie, and largemouth bass. Shallower ponds that have a tendency to winter kill are often stocked with hatchery produced rainbow trout that are stocked either annually or biannually.

HABITAT

The upper section of the Milk River from Hinsdale to Vandalia Dam is shallower and has faster moving water, while the lower section consists of relatively deep slow moving water, because of the influence of Vandalia Dam. The upper section has intact cottonwood galleries with intermixed agricultural fields to the rivers banks.

The section downstream of Vandalia dam is very sinuous with a cottonwood gallery lining the majority of river with patches of agriculture adjacent to the river banks. Throughout most of the year the rivers bed is laden with silt substrate, but when the river flows increase in the spring, those sediments are put into suspension and gravel bars are exposed.

During the flooding of 2011 it was apparent how important an intact riparian zone is on the lower Milk River. Bank sloughing occurred at accelerated rates on lands butting up to agricultural field, with several areas witnessing severe erosion. Conversely, soils with intact riparian vegetation stayed relatively intact.

The largest single factor limiting the lower Milk River is the availability of water during the spring and early summer period. During years of drought, the lower Milk River is often stagnant, with flows approaching zero. From past research there is a good understanding of the relationship between spring and early summer flows and production of several species of native fishes, including game fishes like sauger and paddlefish. During wet years when the Milk River flows for extended periods, several species benefit by running up into the river from the Missouri River and spawning. The duration of flow is critical since once a fish has laid its eggs flows are needed to keep those eggs oxygenated. If flows cease when eggs are incubating, silt will fall back out of the water column and can suffocate the eggs.

FISHING ACCESS

The majority of the lower Milk River flows through privately owned lands. However, some public lands do occur, particularly in the town of Hinsdale and at Vandalia Dam. From Vandalia Dam to its mouth, public access is mostly limited to county bridges. Addressing the lack of public access to the lower Milk River is a priority for FWP.

The prairie ponds within the district occur on a mix of private and public land. Private ponds stocked by FWP are accessible to the public by gaining permission from landowners. A region-wide pond booklet was published in 2011 that provides recreationists with a guide to all ponds managed by FWP in Region 6. This booklet will be updated every two years.

SPECIAL MANAGEMENT ISSUES

During 2010 and 2011, both wild adult and hatchery-reared pallid sturgeon migrated into the lower Milk River from the Missouri River. Although the significance of this in terms of helping with pallid sturgeon recovery is unclear, it is apparent that future studies are warranted.

The Milk River greatly influences the temperature and suspended sediment load of the Missouri River during high flows, due to the fact that low volumes of cold, clear water are typically released out of the reservoir at these times. These physical changes in the Missouri River were observed during 2010 when the Milk River had flows of approximately 6,000 cfs for two extended periods during the spring into the early summer. These flows not only produced fish like paddlefish and sauger in the Milk River, but also contributed to the largest year class of shovelnose sturgeon produced in the Missouri River in recent history. Similarly, during the historic water year of 2011, at least five adult wild pallid sturgeon migrated up the Milk River. This was the second year in a row that adult pallid sturgeon were in the Milk River and during 2011 they were present in the spawning season. Although at this point, the Milk River is not believed to be a spawning river for pallid sturgeon, its effects on the physical nature of the Missouri River are believed to be very important. Therefore, water management in the Milk River could be a reasonable alternative for managing the restoration of pallid sturgeon in the Missouri River.

FISHERIES MANAGEMENT DIRECTION – LOWER MILK RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Milk River (Hinsdale to Vandalia Dam)	16 miles	Channel catfish Sauger, Walleye, Northern pike	Wild	General	Monitor populations for sport fishing. Continue to better understand channel catfish population dynamics.
		Native non- game fishes	Wild	Conservation	Monitor populations to detect changes in species composition and abundance.
Milk River (Vandalia Dam to Missouri River)	117 miles	Channel catfish Sauger, Paddlefish	Wild	Conservation/ Special Regulations	Monitor populations to be certain that over exploitation does not occur. Maintain habitat for all life stages. Study channel catfish population dynamics. Better understand spawning requirements of sauger and paddlefish.
		Northern Pike, Walleye, Smallmouth bass, Yellow perch, Black crappie	Wild	General	Low level effort to monitor populations through native game fish surveys. Allow sustainable harvest.
		Native non- game fishes	Wild	Conservation	Monitor populations to detect changes in species composition and abundance. Better understand the relative contribution of Milk River fishes to the Missouri River
Rock Creek	93 miles	Channel catfish Sauger	Wild	General	Maintain numbers. Inventory habitat issues, such as fish passage barriers and unscreened diversions.
		Native non- game fishes	Wild	Conservation	Protect habitat for native fishes. Provide fish passage at stream crossings.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Prairie Ponds	Various	Yellow perch, Largemouth bass, Northern pike	Wild/ Transport	General	Continue to monitor these populations and stock fish when necessary. Look for opportunities to increase the quality of habitat by increasing the depth of reservoirs, building new reservoirs, etc.
		Rainbow trout	Hatchery	Put-Grow-Take	Continue to stock prairie ponds with put and take fisheries. Evaluate angler use and which ponds should be stocked. Look for opportunities to improve habitat where applicable.

MUSSELHELL RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Musselshell River headwaters start at approximately 9,200 feet elevation and converge with the Missouri River and Fort Peck Reservoir at 2,200 feet. The Musselshell flows from the confluence of the North and South forks (near the Wheatland and Meager county border) for nearly 340 miles. The North Fork flows nearly 32 miles, and the South Fork flows nearly 31 miles. The drainage area covers approximately 8,000 square miles and includes 7,601 surface acres of lakes or reservoirs within 36 individual waterbodies. Detailed fisheries studies from 1979 through 1986 divided the Musselshell into three zones, coldwater, transitional, and warmwater. The coldwater zone extends from the confluence of the North and South forks of the Musselshell near Martinsdale, to Barber (river mile 336 to 256). The transitional zone begins at Barber and extends to Roundup (river mile 256 to 180). The warmwater zone begins at Roundup and extends to its confluence with the Missouri River (river mile 180 to 0). Additionally, the tributaries in the coldwater zone are almost all dominated with coldwater fish species, while tributaries in the transitional and warmwater zones often start out with coldwater species then transition to warmwater species in the lower reaches.

Coldwater Zone

The coldwater zone of the Musselshell River is influenced by several tributaries in addition to the North and South forks. Major tributaries on the North Fork include Checkerboard and Spring creeks. Major tributaries to the South Fork include Alabaugh and Cottonwood creeks. Cottonwood Creek is a popular trout fishery on USFS lands with a fairly accessible mountain lake (Forest Lake). Tributaries downstream from the forks include Daisy Dean, Little Elk, Haymaker, Big Elk, Hopely, Antelope, Lebo, and American Fork creeks along with several smaller creeks. The average width of the Musselshell River in this zone in 1979 was reported to be 60 feet with a gradient of 20.5 feet per mile. Musselshell River substrates are dominated by gravels and cobble in this zone. This zone contains several irrigation storage reservoirs, which alter the natural hydrograph. Major reservoirs include, Bair Reservoir on the North Fork, Martinsdale, an off-channel reservoir on the South Fork, and Deadmans Basin an off channel reservoir on the mainstem. These three reservoirs store a combined volume of approximately 106,616 acre feet of water at full pool. Eleven irrigation diversions are found in the North Fork, South Fork, and mainstem of the Musselshell River, and are capable of diverting a total of 1,400 cfs. of water. Uncounted stock dams, smaller diversion dams and other obstructions are found in the tributary streams in this zone. The physical alterations to the river from water storage practices and irrigation infrastructure have been both beneficial and detrimental to fish populations in this reach. Some structures prevent upstream passage for fish and others, while passable, remove large quantities of water which severely limit in-channel water downstream of the diversions. Conversely, the storage reservoirs often deliver water back to the river for irrigation demands in the summer, which can help maintain some fisheries in periods of drought. Water quality is sometimes a concern in the Musselshell. Land use is dominated by grazing mixed with hay and crop land, and some riparian areas are severely degraded with loss of willow and cottonwood. Agricultural runoff and irrigation returns can increase salinity, nutrient levels

and sediment load, which increase water temperature and turbidity, and decrease dissolved oxygen. Water chemistry data indicate these influences occur throughout the Musselshell watershed starting in the upper reaches and are compounded downstream.

Transition Zone

The transition zone of the Musselshell is influenced by several tributaries including Fish, Careless, Big Coulee, Painted Robe, Dean, Currant, Goulding, Pole, and Halfbreed creeks. The tributaries in this reach are prone to dewatering and are normally dry or intermittent during irrigation season. The average width of the Musselshell River in this zone in 1979 was reported as 85 feet with a gradient of 6.6 feet per mile. The gradient is about a third of that in the coldwater section. Substrate in this section is characterized by gravels, sand, silt, and isolated sandstone rock slabs along sandstone cliffs.

Storage reservoirs are not found in this zone, although water releases from Deadmans Basin via a canal ultimately returns water into Careless Creek which is part of this zone. At least 10 irrigation diversions are found in this zone (four major diversions have been reported to be capable of diverting a total of 200 cfs), and several additional rock weirs appeared to be in place to raise the river stage for irrigation pumps. A few of the larger diversions were breached or flanked during the 2011 flood, with several still not repaired or replaced in spring of 2012. The physical alterations in this zone may seasonally preclude fish passage, and because the diversions lack screens, many fish are carried onto fields each year or trapped in canals and siphons when they are dewatered each fall. Water quality issues exist in this zone due to irrigation returns that increase salinity (sodium sulfate) and cause nutrient enrichment. Changes in operational releases of water from Deadmans Reservoir through Careless Creek have reduced, but not eliminated, these effects. The dewatering for irrigation purposes in this zone reduces the fishery potential by reducing available habitat.

Warmwater Zone

The warmwater zone of the Musselshell River is influenced by several tributaries: Willow, Flatwillow, Box Elder, Fattig, Hawk, Rattlesnake, Calf, and Lodgepole creeks, in addition to several small intermittent drainages. The average width of this zone in 1979 was reported as 100 feet, with an average gradient of 3 feet per mile, which is half of the transition zone's average gradient. Substrates in this zone are dominated by silt and sand, with some interspersed gravels and bedrock. Five major irrigation diversions have been reported to be capable of diverting a total of 418 cfs. Flatwillow Creek is the largest tributary in the warmwater zone. Petrolia Reservoir, an on-stream irrigation reservoir on Flatwillow Creek that has approximately 9,000 acre feet of storage, severely limits flow immediately downstream in Flatwillow Creek during low-water periods. At least seven dams can be found from Roundup to the Davis/Korenco Dam, three miles downstream of the town of Musselshell. No other major dams or diversions are known on the river from this point to the confluence with the Missouri River. Physical alterations to the river by diversion dams and check dams have fragmented the river during the periods outside of spring high flows. The Delphia Melstone Dam at Musselshell and the Davis/Korenco Dam downstream have been shown to preclude fish passage on a regular basis. Channel catfish and smallmouth bass were documented moving upstream of the Delphia Melstone Dam, but the movements were made during higher than average water events and population surveys have not

found substantial populations of game fish species above this dam. Other upstream dams also have the ability to reduce upstream passage of fish into the transition zone.

FISHERIES MANAGEMENT

Over 42.5 million fish were stocked in the Musselshell watershed by FWP from 1928 to 2009. The most commonly stocked species has been rainbow trout with over 27 million individuals totaling more than 1 million pounds stocked. Many of these have been stocked in major reservoirs in the drainage such as Martinsdale, Bair Reservoir, Deadman's Basin, Lebo, and Yellow Water. Essentially all stocking of trout directly into the river was halted by 1980. Stream stocking accounted for many of the rainbow trout from 1928 through 1982. Most rainbow trout recently found in the river are from reservoir stockings. Westslope cutthroat trout stocked into Bair Reservoir recently were found pioneering the river below the dam.

Coldwater Zone

The coldwater zone and associated tributaries support many species of fish such as brook trout, brown trout, rainbow trout, Yellowstone and westslope cutthroat, mountain whitefish, longnose dace, Rocky Mountain sculpin, longnose, shorthead redhorse, white, and mountain suckers, occasional fathead minnows, flathead chubs, common carp, stonecat, lake chub, northern redbelly dace, and northern redbellyxfinescale dace hybrids. The mainstem supports a good population of brown trout (comprising about 96% of the total trout) and mountain whitefish, while the tributaries support brook trout (about 56% of the total trout), and lesser numbers of rainbow and brown trout, mountain whitefish, and both species of cutthroat trout. Brown trout are also the most common species in much of the North and South forks. Arctic grayling (native to Montana, but not the Musselshell watershed) were stocked in the upper reaches of the South Fork of the Musselshell in two separate ponds in 1961; however, records indicate neither introduction became self-reproducing.

Brown trout population estimates have been completed at the Selkirk Fishing Access Site on an irregular basis since 1984. Current management plans are to conduct population estimates at this site once every 3 years. Many of the estimates attempted in the 2001-2008 time period were not completed, as recapture rates were low and the population consisted of a few larger adults and more abundant, but still relatively few juveniles. The poor population structure during this time was related to poor in-stream flow conditions during a drought. Brown trout population estimates ranged from a low of 17 total fish caught in an electrofishing effort to estimates of 890 brown trout per mile in 1992, which was attributed to a good spawn in 1991. Average density for all years is approximately 300 fish per mile, with about 150 of quality size and the remainder consisting of yearling fish.

Angling pressure in this zone is low. In 2009, the FWP Angler Survey indicated the Musselshell River in the cold zone received 1,750 angler days, with an additional 1,200 angler days in the North and South forks of the river.

Transition Zone

The transition zone supports at least 17 species of fish, but the abundance of sport fish is generally reported as low. Documented species include stonecat, several minnow species (carp, fathead minnow, flathead chub, lake chub, longnose dace, and western silvery minnow), several

sucker species (longnose, mountain, river carpsucker, and shorthead redhorse), smallmouth bass, brown trout and mountain whitefish. Additionally Deadmans Basin Reservoir in this zone contains stocked populations of rainbow trout, kokanee salmon, and tiger muskie. Atlantic salmon and coho salmon have also been stocked into Deadmans Basin, however those species are no longer in the reservoir or river. It is likely some catfish and sauger (at times of high water) are in this zone near Roundup, but they have not been reported in any survey from 1979 to present. Discussions with longtime anglers indicated sauger and catfish were more common in the 1950's and 1960's as far up as Lavina. Brown trout are found in the upper transition zone along with an occasional rainbow trout however in numbers much lower than those in the coldwater zone.

Warmwater game fish densities in this zone may be attributed to irrigation diversions inhibiting movements. The warmer river sections would likely provide good habitat for channel catfish if they could migrate upstream past existing barriers. Sauger would likely be found in this zone each spring, migrating back to the warmwater zone and Missouri River by midsummer if existing dams were passable. Food is not likely limiting, as forage fish populations found in this section of river are strong enough to support higher abundances of predatory fish than are currently found.

Smallmouth bass were stocked from 1977 to 1981 from Lavina to Roundup. This population didn't expand very quickly, and many of these stocked bass were later found downstream of the transition zone in the warmwater zone. Nonetheless, limited recruitment was documented, and the bass that were found in the transition zone were documented as some of the fastest in Montana. Reports by anglers indicate smallmouth bass have been caught as far up as Lavina, but good populations are not found until Roundup. These reports indicate several dams create barriers with water depletions compounding the effects and limiting upstream expansion. In combination with several barriers to upstream movement, warm water temperatures in the fall likely limit populations of smallmouth bass.

Deadmans Basin Reservoir is included in the transition zone because return water enters in the transition zone through the Barber Canal and Careless Creek. Any fish that move out of the reservoir could reach the river, however notable populations of rainbow trout, kokanee salmon, and tiger muskie have not been documented in the transition zone. The reservoir provides habitat for white, shorthead redhorse, and longnose suckers, carp, as well as a limited number of minnow species that enter the reservoir through the Deadmans canal. The Deadmans fishery relies heavily on a stocking program for rainbows, kokanee and tiger muskie. Without stocking, this reservoir would provide a limited fishery for brown trout that come from the coldwater zone via the Deadmans canal system.

In 2009, the FWP Angler Survey estimated that Deadmans Basin Reservoir received 9,702 angler days; 8,885 were from resident anglers. The reservoir ranked statewide as the 82nd most fished water out of over 1,430 different waters reported. The Musselshell River in the transition zone and warmwater zone received 3,647 angler days of use.

Warmwater Zone

Despite severe dewatering problems, high temperatures and poor water quality, the warmwater zone still contains a nearly intact native fish ecosystem. The warmwater zone has been

documented to support at least 31 species of fish. This species list includes catfish (black bullhead, channel catfish, and stonecat), minnows (brassy minnow, carp, emerald shiner, fathead minnow, flathead chub, longnose dace, plains minnow, sand shiner, spottail shiner, and western silvery minnow), suckers (longnose sucker, blue sucker, mountain sucker, river carpsucker, shorthead redhorse, smallmouth buffalo, bigmouth buffalo and white sucker), walleye, sauger, black crappie, bluegill, green sunfish, smallmouth bass, burbot, freshwater drum, goldeye, and northern pike. Many of these species are not found at Roundup, but most are found below the Delphia-Melstone Diversion Dam at the town of Musselshell. Unverified reports of paddlefish being found in a field near Melstone were made as the flood waters of 2011 receded. FWP reported angling pressure of 2,360 angler days for the lower 80 miles of river in 1963. In 2009, the pressure was estimated to be 3,647 angler days.

HABITAT

Habitat issues requiring attention are habitat fragmentation from irrigation structures, meander cutoffs from railroad and road projects, and near dewatering of the Musselshell River. Channel instability due to a railway bed and highway projects cutting off meander bends has caused loss of habitat for fish. The flood of 2011 changed many sections of river by creating cutoffs and, in some cases, breaching the abandoned railroad berm, re-establishing some bends as well as flanking and bypassing several irrigation structures which reopened fish passage. Recent down-cutting of the channel has reduced channel length in the Musselshell River by about 8% for its full length and about 21% below Flatwillow Creek. Channel widening associated with the 2011 flood will strongly influence fish habitat. Dozens of miles of abandoned channel may also play an important role in the prairie stream and riparian ecosystem.

Over the past decade, the water judge, the Musselshell Distribution Project, and efforts of the Musselshell Water Coalition, have resulted in more water being conveyed in the main channel compared to the transition and warmwater zones. Additional water rights for instream flow would further improve conditions.

Coldwater Zone

Wetted perimeter analysis above Harlowton determined that 80 cfs is necessary to sustain a consistently high-quality wild brown trout fishery in the coldwater section. Bankfull flow near Martinsdale was approximated to be 1,060 cfs at a two-year recurrence interval, which typically occurs in June. The 1.25 year recurrence flow was reported as 514 cfs. These studies recommended a flow of 1,060 cfs be allowed to occur for at least 24 hours in June, with the remainder of June at 514 cfs to maintain channel habitat for trout production. As a minimum, observations at flows of 42.8 cfs indicated many riffles were exposed, and fish habitat along the banks was dewatered, leaving fish in cover-limited pools.

Transition Zone

Wetted perimeter analysis in a reach just downstream of the city of Roundup determined that a flow of 80 cfs is needed for fishery maintenance. In the 1980's, TFWP found some gravel bars were exposed at 76.7 cfs but determined that this flow still provided moderate fish habitat. The 2 year and 1.25 year recurrence flows were not reported for this zone. These values are important

to determine because they represent flows that typically maintain habitat and transport and redistribute silts and other sediments.

Warmwater Zone

Wetted perimeter analysis at the Mosby Bridge resulted in a recommendation of 70 cfs to be met year round for fishery maintenance. In the 1970's, bankful discharge for 2-year flood was estimated at 4,080 cfs, and 1.25-year flood was estimated at 1,860 cfs. It was recommended that these flows be provided annually during runoff, with 4,080 cfs for 24 hours and 1,860 cfs for several weeks after the high flow to help maintain fish habitat.

Studies determined that the Davis/Korenc Dam and Delphia-Melstone Dam create barriers for fish most of the time, but catfish and bass were able to bypass these structures during some high water events. Sauger and walleye were not documented passing these diversion dams. Because of tremendous overbank flooding in 2011, it is probable sauger, walleye and other species, if present, were able to bypass these dams. One burbot and a freshwater drum were caught below the Davis Dam in 1981 by FWP and a second burbot was reported by an angler as far up as Shawmut. These fish likely migrated from the Missouri River during spring flows. Good fishing can occur in the warmwater zone, but it is impaired due to erratic discharges and dams. If the Davis and Delphia-Melstone dams became passable to fish, it is likely other upstream dams would become the limiting factors to upstream fish movements during most flows. However, those upper dams represent less of a fish passage challenge than the lower two dams. FWP studies have also determined that the channel catfish in the warmwater zone often migrate between the Musselshell and the Middle Missouri Rivers.

FISHING ACCESS

The four FASs in this watershed are: Martinsdale Reservoir, Selkirk, Harlowton, and Deadmans Basin Reservoir, all in the Coldwater Zone. Other limited access can be found on Forest Service, BLM, state, county and city lands, and with permission by private landowners. Additional public access is needed throughout the basin, particularly in the warmwater zone. Recreation infrastructure on Bair Reservoir is in extremely poor condition.

SPECIAL MANAGEMENT ISSUES

The flood of 2011 created extensive opportunity in much of this management area to improve the river for fish and wildlife use. Water managers have improved instream flow conditions over the past decade with the Musselshell River Distribution Project. It is important that FWP continue to support this project. This area provides a great potential for developing and improving native sauger and channel catfish populations, and already supports a very good assemblage of native minnows and suckers that would benefit from additional habitat enhancement.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

FISHERIES MANAGEMENT DIRECTION FOR MUSSELHELL RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
North Fork Musselshell - Headwaters to Bair Reservoir	11 miles	Brook trout	Wild	General	Manage as a recreational fishery at historic levels
Habitat needs and activities: Maintain flows of 3 cfs for habitat.					
Bair Reservoir	221 acres	Rainbow trout, Westslope cutthroat trout	Hatchery	Put-Grow-Take	Continue stocking at current rates
		Brook trout	Wild	General	Manage as a recreational fishery with consumptive harvest.
North Fork Musselshell – Bair Reservoir to South Fork	16.5 miles	Brook trout	Wild	General	Manage as a recreational fishery at historic levels
		Brown trout	Wild	General	Evaluate population and potential for reproduction and harvest.
		Westslope cutthroat trout	Wild	General	Hatchery fish from Bair Reservoir
Habitat needs and activities: Maintain flows of 16 cfs for habitat.					
Checkerboard Creek	6.5 miles	Brook trout, Brown trout, Rainbow trout	Wild	General	Manage all as a recreational fishery at historic levels
Habitat needs and activities: Maintain flows of 6 cfs for habitat.					
Spring Creek	12 miles	Brook trout	Wild	General	Manage as a recreational fishery at historic levels
Habitat needs and activities: Maintain flows of 8 cfs for habitat.					
South Fork Musselshell River	30 miles	Brook trout, Brown trout, Rainbow trout	Wild	General	Manage all as a recreational fishery at historic levels
Habitat needs and activities: Maintain flows of 30 cfs for habitat.					
Alabaugh Creek	9 miles	Brook trout, Brown trout, Rainbow trout	Wild	General	Manage all as a recreational fishery at historic levels
Habitat needs and activities: Maintain flows of 12 cfs for habitat.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Cottonwood Creek	10.8 miles	Brook trout, Brown trout, Rainbow trout, Westslope cutthroat trout hybrids	Wild	Special Regulations	Manage as a recreational fishery at historic levels
Habitat needs and activities: Maintain flows of 16 cfs for habitat.					
Martinsdale Reservoir	947 acres	Rainbow trout, Westslope cutthroat trout	Hatchery	Put-Grow-Take	Continue stocking at current rates
		Brown trout	Wild	General	Manage all as a recreational fishery with consumptive harvest.
Habitat needs and activities: Maintain connectivity work through programs to improve riparian area and stream habitat. Continue to support Musselshell River Distribution Project. Maintain flows of 80 cfs for habitat.					
Musselshell River Coldwater Zone (Confluence of North and South Forks to Barber)	53 miles	Brook trout, Rainbow trout, Brown trout, Mountain whitefish	Wild	General	Maintain and enhance populations
American Fork	34 miles	Brook trout, brown trout	Wild	General	Manage as a recreational fishery at historic levels.
Lebo Creek	32 miles	Native minnow	Wild	Conservation	
Lebo Lake	309 acres	Tiger muskie, Rainbow trout, Brown trout	Hatchery	Put-Grow-Take	Not currently managed. Former Private Pond/Public Fishing pond. Would like to re-establish access and manage for species indicated.
Big Elk Creek	25 miles	Brook trout, Brown trout	Wild	General	Manage as a recreational fishery at historic levels.
Daisy Dean Creek	28 miles	Brook trout	Wild	General	Manage as a recreational fishery at historic levels.
Habitat needs and activities: Work with USFS for solutions to reduce/prevent impacts on riparian area from ATV traffic on Daisy Dean.					
Chief Joseph Pond	2 acres	Rainbow trout	Hatchery	Put-Take	Continue stocking at current rates

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Forest Lake	21 acres	Cutthroat hybrids	Wild	General	Evaluate periodically. Manage as a recreational fishery at historic levels
Haymaker/ East Fork Haymaker	30 miles	Yellowstone Westslope cutthroat trout	Wild	General	Manage as a recreational fishery at historic levels
Deadmans Reservoir	2,120 acres	Tiger muskie	Hatchery	Put-Grow-Take/ Quality	Continue stocking at current rates, limit harvest to 1 over 40". Used to reduce sucker population in reservoir to improve trout and salmon growth.
		Rainbow trout, Kokanee salmon	Hatchery	Put-Grow-Take	Stock at current rates
Musselshell River Transition Zone (Barber to Roundup)	138 miles	Smallmouth bass	Wild	General	Evaluate 1970/1980's stocking to maintain fishery
		Channel catfish	Wild	Conservation	Reintroduce/enhance population and expand to Deadmans Diversion. Consider potential for fish transfers and stocking to accomplish.
		Sauger	Wild	Conservation	Consider expanding population to Deadmans Diversion. Consider potential for fish transfers And stocking to accomplish.
		Native minnow assemblage	Wild	General	Improve or maintain habitat and water conditions
Habitat needs and activities: Improve habitat to support ecosystem function and production of trout, whitefish, and native minnow and sucker populations. Maintain flows of 80 cfs for habitat in the Musselshell River					
Fish Creek	86 miles	Brook trout,	Wild	General	Manage as a recreational fishery at historic levels.
		Native minnow assemblage	Wild	Conservation	Improve or maintain habitat and water conditions

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

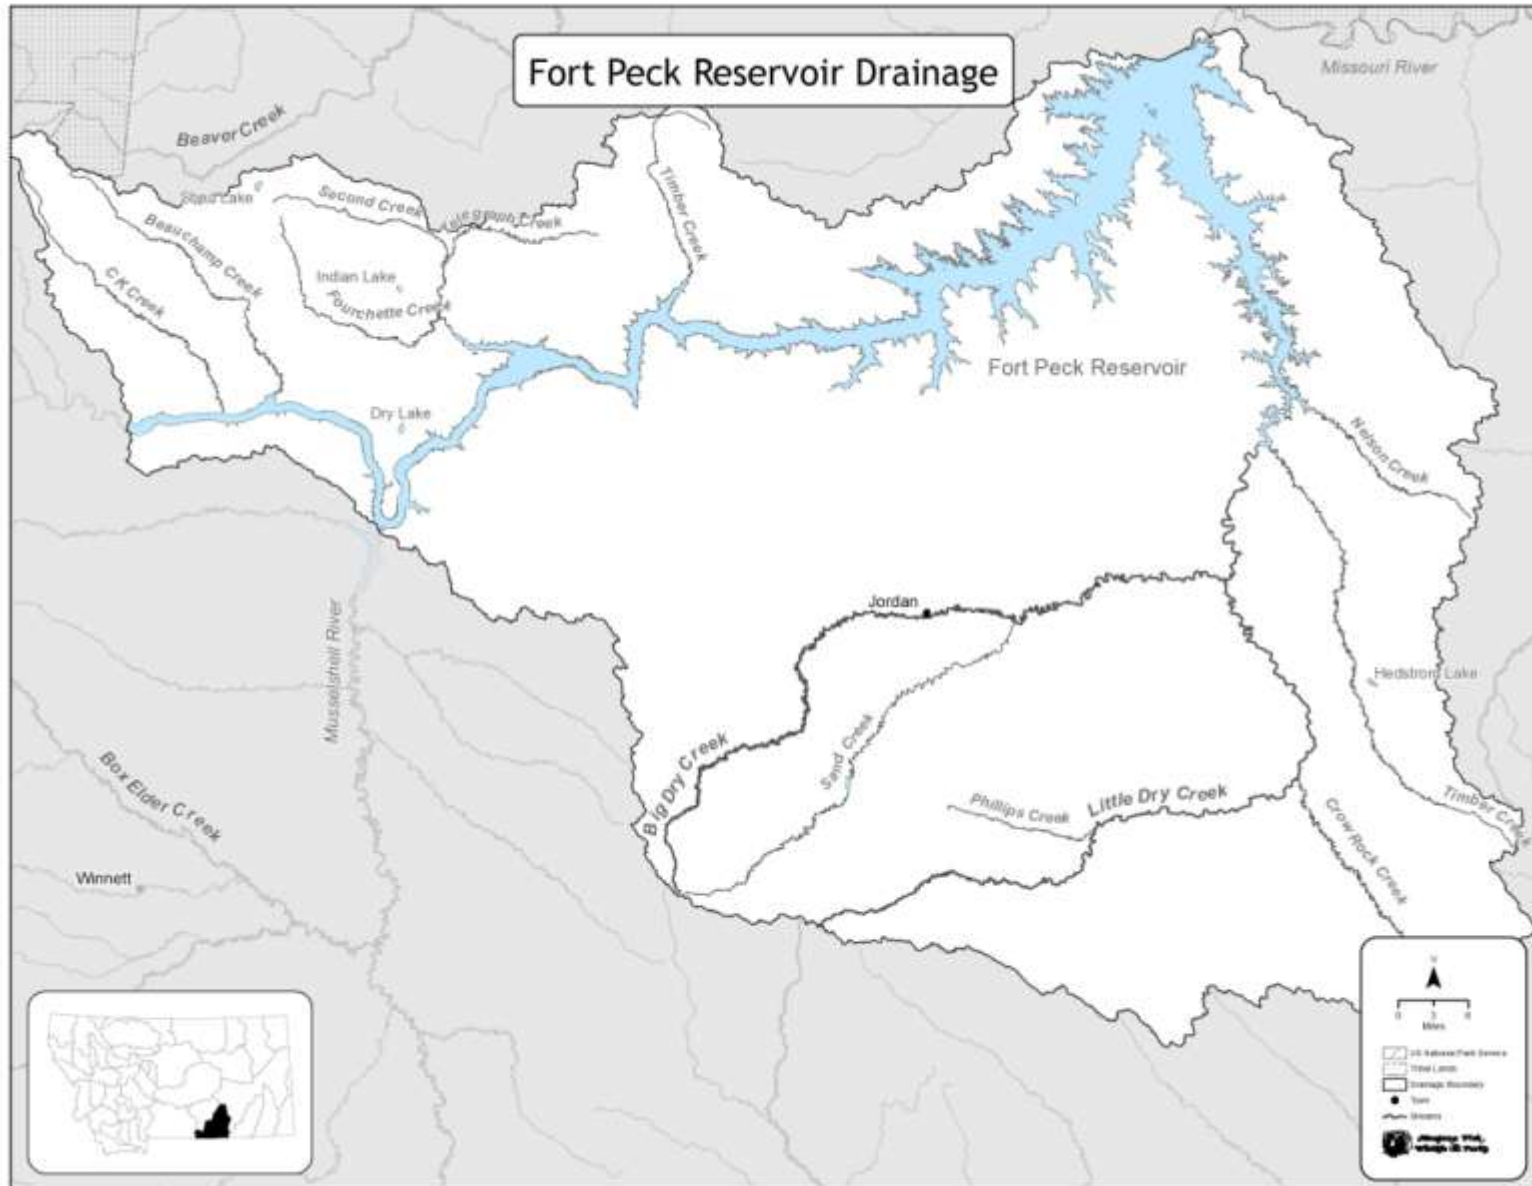

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Careless Creek and Little Careless Creek	68 miles	Native minnow and sucker populations	Wild	Conservation	Improve and maintain fish passage this tributary has one of the best native minnow populations in the area.
Big Coulee	51 miles	Native minnow Sucker species	Wild	Conservation	Improve or maintain habitat and water conditions
Painted Robe Creek	38 miles	Native minnow Sucker species	Wild	Conservation	Improve or maintain habitat and water conditions
Swimming Woman Creek	33 miles	Brook trout	Wild	General	Manage as a recreational fishery at historic levels.
		Native minnow Sucker species	Wild	Conservation	Improve or maintain habitat and water conditions
Currant Creek	60 miles	Native minnow Sucker species	Wild	Conservation	Improve or maintain habitat and water conditions
Musselshell River Warm water Zone (Roundup to Confluence with Missouri River)	151 miles	Smallmouth bass	Wild	General	Manage as a recreational fishery at historic levels.
		Channel catfish	Wild	Conservation	Manage as a recreational fishery at historic levels.
		Sauger	Wild	Conservation	Limited population consider stocking and wild fish transfers from other waters
		Native minnow assemblage	Wild	Conservation	Improve or maintain habitat and water conditions
		Drum	Wild	Conservation	Maintain viable population
		Rainbow trout	Hatchery	Put-Grow-Take	Continue stocking reservoirs annually
		Burbot	Wild	Conservation	Evaluate population, improve fishery
		Walleye	Wild	General	Evaluate population movements and influence on other fish consider increasing harvest

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Habitat needs and activities: Continue to manage connectivity to favor native fish. Maintain instream flow of 70 cfs on the Musselshell downstream of the Musselshell Diversion dam for habitat. Establish additional gage stations.					
Willow Creek	71 miles	Brook trout	Wild	General	Maintain viable population
		Native minnow Sucker species	Wild	Conservation	Improve or maintain habitat and water conditions
Flatwillow Creek	118 miles	Brook trout, Brown trout,	Wild	General	Manage all as a recreational fishery at historic levels
		Native minnow Sucker species	Wild	Conservation	Improve or maintain habitat and water conditions
Habitat needs and activities: Maintain flows of 15 cfs for habitat. Additional access is needed upstream of highway 87.					
South Fork Flatwillow Creek	23 miles	Brook trout	Wild	General	Manage all as a recreational fishery at historic levels
North Fork Flatwillow Creek	25 miles	Brook trout	Wild	General	Manage as a recreational fishery at historic levels
Tributaries to Flatwillow and Box Elder Collar Gulch and Halfmoon Creek	5 miles	Westslope cutthroat trout	Wild	Conservation	Enhance and protect populations. Continue to work on project to expand westslope cutthroat trout in the Judith Mountains.
Habitat needs and activities: Maintain flows of 0.6 cfs for habitat in Collar Gulch Creek.					
Petrolia Reservoir	518 acres	Walleye, Rainbow trout	Hatchery	Put-Grow-Take	Manage as a recreational fishery with consumptive harvest
		Northern pike, Yellow perch	Wild	General	Manage as a recreational fishery at historic levels.
Jakes Reservoir	18 acres	Sauger	Wild	General	Evaluate options for additional stocking of sauger such as via wild fish transfer.
		Yellow perch	Wild	General	Manage as a recreational fishery with consumptive harvest

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Numerous BLM Ponds		Largemouth bass, Crappie, Rainbow trout	Hatchery	Put-Grow-Take	Maintain stocking at current rates Manage recreational fisheries with consumptive harvest
Habitat needs and activities: Coordinate with BLM for water level management, dam repair and habitat concerns.					
Numerous Private Ponds Public Fishing		Largemouth bass, Rainbow trout	Hatchery	Put-Grow-Take	Maintain stocking at current rates

FORT PECK RESERVOIR DRAINAGE

PHYSICAL DESCRIPTION

Fort Peck Reservoir is formed by a large earth-filled dam located on the Missouri River in the northeastern part of Montana. Completed in 1937, it is the largest body of water in the state, with 246,000 surface acres and 1,520 miles of shoreline at full pool. The reservoir is 134 miles in length and has a maximum depth of 220 feet when full. Major tributaries to Fort Peck Reservoir include the Missouri River, the Musselshell River, and Big Dry Creek. The Musselshell and Missouri rivers are discussed in their own drainage plans. The habitat at the mouths of these streams is closely tied to Fort Peck Reservoir levels; several stream miles are inundated at normal to high pool levels. This watershed encompasses a drainage basin of 57,500 square mile basin and is located within Phillips, Valley, Fergus, Petroleum, Garfield, and McCone counties. Administration of all land and water within the executive boundary of the Charles M. Russell (CMR) National Wildlife Refuge is shared by the U.S. Fish & Wildlife Service and the U.S. Army Corps of Engineers (USACE) in accordance with a Memorandum of Agreement. The reservoir is operated by the Corp of Engineers to provide water for power, flood control, irrigation, navigation and recreation.

FISHERIES MANAGEMENT

The fishery in Fort Peck Reservoir is diverse with 47 different fish species, most of which are native to the Missouri River. Sixteen species, mostly game fish, have been introduced by FWP to develop sport-fishing opportunities. Walleyes and northern pike were both introduced in 1951 followed by lake trout in the mid 1950's. Smallmouth bass were introduced in 1981 and chinook salmon in 1983. During the 1980's spottail shiners and cisco were also introduced to supplement the existing forage base. Additionally, native game fish including burbot, channel catfish, paddlefish, and sauger are sought by anglers throughout the reservoir. Because of the diversity and world class fishery that Fort Peck Reservoir has to offer, it is ranked number one in the region in number of angler days, and within the top ten on a statewide level.

The quality multi-species fishery found in the reservoir is the result of ongoing management efforts by FWP. Key to this effort is an understanding of the variable nature of fish populations. Specifically, natural reproduction is largely influenced by reservoir water levels and environmental conditions at time of spawn. As a result, extensive stocking programs for walleye and chinook salmon are in place to reduce population variability. These introductions were carefully analyzed to determine the long-term benefits to the fishery. Evaluation of management success is done through standardized monitoring combined with angler surveys. This basic monitoring program allows estimates of catch rates, size of fish, and overall angler satisfaction .

HABITAT

Fort Peck Reservoir, much like other storage reservoirs, typically has annual varial zones where annual water level fluctuations produce a suite of impacts to the aquatic environment and associated terrestrial environment. This unstable zone is subject to loss of aquatic and terrestrial plants and associated populations of phytoplankton and benthic organisms. Lack of submerged vegetation causes a decline in the overall productivity of the entire fish population by reducing

food supply, spawning habitat, and rearing cover. Submerged vegetation also provides protective cover for forage fish and young game fish species. Additionally, varial zones may provide areas for successful colonization of aquatic invasive species such as Eurasian Watermilfoil, a submerged aquatic weed discovered in 2010, because there is no healthy native aquatic plant community to provide competition.

During the late 1950's and early 1960's rising water levels on Fort Peck Reservoir inundated vegetation and produced an outstanding fishery for northern pike, crappie, and yellow perch. In addition, walleye abundance improved after increases in reservoir elevation and high flows in the Big Dry Arm during the late 1970's. Higher reservoir elevations and increased flows allowed adult walleye to access suitable spawning substrate in the Big Dry Arm. Water level management to promote successful walleye spawning was not possible. . As a result, this high quality fishery was maintained with stocking. Recommendations from FWP to enhance and maintain the Fort Peck fishery are submitted annually to the USACE for inclusion into the Annual Operating Plan process. Montana requests are coordinated with other Missouri River states through the Missouri River Natural Resource Committee.

Attempts by local sportsman groups to improve spawning habitat to enhance the fishery have been undertaken in the form of spawning fences and Christmas tree reefs. However, due to the vastness of the reservoir, no measurable benefits to the fishery have been noted. Cobble or rock spawning reefs have been considered to aid natural reproduction of walleye, but cost is prohibitive and long-term effectiveness is uncertain due to siltation and water level fluctuations.

FISHING ACCESS

Fort Peck Reservoir is surrounded by public access within the CMR National Wildlife Refuge. However, due to the size of the reservoir and poor condition of roads/trails, access opportunities are somewhat limited. A total of 13 public access sites (12 boat ramps) are located around the reservoir, which are administered by USACE. These recreation sites are managed privately or by federal government natural resource agencies. Specific recreation sites managed by FWP include Duck Creek FAS near Fort Peck, Rock Creek FAS on the Big Dry Arm of the reservoir, and Hell Creek Recreation Area north of Jordan, which is managed by the FWP Parks Division. Various projects have been implemented over the years to improve access to Fort Peck Reservoir through the joint efforts of five counties, federal agencies, and FWP. Various local, state and federal funds were used to accomplish this work. The projects included work on access roads and boat ramp facilities at the Duck Creek FAS, Pines recreation area, Hell Creek, Crooked Creek, Flat Lake/Spillway, and Nelson Creek Recreation areas. Efforts by six surrounding counties, US Fish and Wildlife Service, USACE, BLM, and FWP resulted in additional improvements on access routes to Hell Creek, Crooked Creek, McGuire Creek, the Pines, and Fourchette Bay.

SPECIAL MANAGEMENT ISSUES

The 2012-2022 Fort Peck Reservoir Fisheries Management Plan was completed in December of 2011. The Plan reflects the public's desire for a high quality, cost effective, multi-species fishery in Fort Peck Reservoir. Additionally, this plan represents the on-going evolution of fisheries management on Fort Peck Reservoir. Of principal importance is to efficiently develop scientifically sound sampling methods that quantify the essential metrics needed to gain additional insight into the Fort Peck Reservoir fishery. The following is a synopsis of the plan.

Walleye Stocking

FWP will aim to stock a minimum of 3.0 million walleye fingerlings annually in Fort Peck Reservoir. Fingerling stocking will be augmented with fry as conditions and availability allow.

Walleye fingerling production at the hatcheries will depend on quality and quantity of eggs collected, egg hatching success and pond production. If fingerling production exceeds 3 million, biological and environmental conditions (listed below) will be reviewed to determine if stocking additional walleyes is justified. Stocking rates may be reduced if biological and environmental conditions are unfavorable to maintaining a high quality walleye fishery. Continue to evaluate walleye fingerling and fry survival and recruitment. Walleye stocking rates will be guided by reservoir water levels, physical condition of the existing walleye population, and forage fish abundance. The goal of this plan is to maximize hatchery production of walleye to ensure that biologically based stocking rates are met.

Walleye Catch Rates

FWP will work to achieve angler catch rates of 0.4 walleye per hour during periods of the summer creel on Fort Peck Reservoir. The highest documented angler catch rate for walleye on Fort Peck Reservoir occurred in 2008, with 0.28 fish per hour. The goal of 0.4 fish per hour will likely not occur throughout the reservoir but seasonally in regions of the reservoir. For example, walleye catch rates of 0.5 fish per hour were observed in July during the 2008 Fort Peck creel survey. Walleye fisheries in surrounding states and provinces throughout the Midwest, which have limited natural reproduction, like Fort Peck, consistently have lower catch rates. Walleye catch rates exceeding 0.3 fish per hour are generally considered excellent. The goal of this plan is to maximize walleye angler catch rates while ensuring a sustainable walleye fishery.

Tournaments

Angling tournaments continue to grow in popularity on Fort Peck Reservoir. In 2001, the first year of the previous Fort Peck fisheries management plan, three walleye tournaments and one smallmouth bass tournament were permitted. In 2011, 13 tournaments were proposed consisting of eight walleye, three smallmouth bass, one northern pike, and one salmon/lake trout tournament. The increase in proposed tournaments in 2011 on Fort Peck Reservoir led to the denial of one tournament entry because management plan stipulations under the old plan stated that no more than 12 open water tournaments will be held per year. The management plan further stated that preference will be given to applicants who held previous tournaments on Fort Peck Reservoir. This structure has led to inequality for non-established tournaments because established tournaments occupy the 12 available slots.

Because of the increasing number of tournaments and scheduling conflicts with holiday weekends on Fort Peck Reservoir, the 2011 open water season had a tournament scheduled every weekend during the months of June and July minus the holiday weekends. Non-tournament anglers have expressed frustration with the lack of tournament-free weekends during peak summer months and state that impacts associated with tournament pre-fishing needs to be

addressed. The goal of the current plan is to reduce conflict between non-tournament anglers while ensuring the tradition of tournament fishing continues. The following list of criteria will be used to meet this goal.

Fort Peck Reservoir Management Plan Tournament Guidelines

1. A maximum of 16 tournaments will be permitted per calendar year.
 - a. No more than 12 open water and 4 ice tournament will be permitted per calendar year.
 - b. No more than 6 tournaments will be permitted from June 1st through July 30th.
 - c. No tournaments will be permitted for the weekends of Memorial Day, Father's Day, Fourth of July, or Labor Day.
 - d. Only one tournament per weekend will be permitted.
 - e. Established Fort Peck tournaments of 10 consecutive years or more will be given preference.
 - f. Applicants will be required to list first, second and third choice tournament dates on applications.
 - g. In years where more applications are received than available tournament dates, applications will be entered in a lottery.
 - h. Unsuccessful applicants will receive one bonus point. Tournament applications will be entered into the lottery in subsequent years and bonus points will be applied (e.g. if an applicant has accumulated one bonus point, that application will be entered into the lottery two times).
2. Tournaments will be reviewed on an individual basis. Evaluation of proposed tournaments will include potential biological and social impacts. Proposed tournaments will undergo a 30-day public review and comment period.
3. All catch and release tournaments with weigh-in type format will be limited to cool weather periods: May-June 15, or after September 15.
4. Tournament boundaries must be clearly defined in the application. Proposed boundary size should be minimized in an effort to reduce tournament related fish mortality caused by fish being held in live-wells for extended periods of time and/or traveling long distances.

Tournament directors will be required to report post-tournament catch-rate information in a standardized format.

FISHERIES MANAGEMENT DIRECTION FOR FORT PECK RESERVOIR DISTRICT

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Fort Peck Reservoir (Headwaters Downstream to Fort Peck Dam)	246,000 acres	Walleye	Hatchery/ Wild	General	Continue to place the primary management emphasis on walleye. Adhere to stocking guidelines of the Fort Peck Reservoir Fisheries Management Plan.
		Northern pike, Smallmouth bass	Wild	General	Continue to monitor populations. Rely on variable natural reproduction and survival to determine population levels.
		Lake trout	Wild	General	Rely on variable natural reproduction and survival to determine population abundance. Evaluate stocking lake trout if conditions warrant. Monitor populations through annual surveys.
		Chinook salmon	Hatchery	Put-Grow-Take	Adhere to stocking guidelines of the Fort Peck Reservoir Fisheries Management Plan. Monitor populations through annual surveys.
		Burbot, Channel catfish Sauger	Wild	General/ Special Regulations	Continue to monitor populations. Better understand factors for limited recruitment.
Sentinel Reservoir	14 acres	Rainbow trout	Hatchery	Put-Grow-Take	Manage for put grow and take rainbow trout fishery.
Habitat needs and activities: Look for opportunities to increase riparian habitat and aesthetic values.					
Big Dry Creek/ Little Dry Creek	149 miles 69 miles	Channel catfish	Wild	General	Continue to monitor populations.
		Multi-species	Wild	General/Conservation	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Trout Ponds North of Reservoir- Located Throughout Blaine, Phillips, and Valley Counties	Numerous	Rainbow trout, Brook trout	Hatchery	Put-Grow-Take	Monitor water conditions and impacts from winterkill. Stock trout based on current 6-year stocking plan.
Habitat needs and activities: Work with Bureau of Land Management and landowners to increase riparian habitats and aesthetic landscapes surrounding the ponds. Maintain windmill aeration systems on ponds with marginal depths.					
Warmwater Reservoirs and Ponds North of Reservoir- Located Throughout Blaine, Phillips, and Valley Counties	Numerous	Largemouth bass, Northern pike, Walleye, Smallmouth bass, Channel catfish Black crappie, Yellow perch, Bluegill	Wild/ Hatchery	General/ Put-Grow- Take	Manage as self-sustaining fisheries. Supplement populations with hatchery stocking and wild fish transfers as needed. Monitor water conditions and impacts from winterkill.
Habitat needs and activities: Work with Bureau of Land Management and landowners to increase riparian habitats and aesthetic landscapes surrounding the ponds. Maintain windmill aeration systems on ponds with marginal depths.					
Private Ponds/Reservoirs South of Reservoir in FWP Region 7 Pond Program	Numerous	Trout	Hatchery	Put-Take	Public relations opportunity with landowners to provide local fishing opportunity for rural community. Maintain fishery through regulations and annual stocking
		Bass, Walleye, Northern pike	Wild/ Hatchery	General/Put-Grow- Take	Public relations opportunity with landowners to provide local fishing opportunity for rural community. Maintain fishery through regulations and stocking when necessary
		Crappie, Yellow perch, Bluegill	Wild/ Transfer	General	Public relations opportunity with landowners to provide local fishing opportunity for rural community. Provide panfish angling opportunity, supplement population through wild fish transfers when necessary.

MISSOURI RIVER - POPLAR DRAINAGE

PHYSICAL DESCRIPTION

The Missouri-Poplar drainage includes the Missouri River from Fort Peck Dam downstream to its confluence with the Poplar River, Prairie Elk Creek, Wolf Creek, Redwater River and the Poplar River. The watershed encompasses approximately 4,000 square miles located in Valley, Roosevelt, Daniels and McCone counties. The watershed includes private, state and federal lands, including the majority of the Fort Peck Indian Reservation. Agriculture dominates the lands north of the Missouri River, with wheat farming being the dominant crop. Irrigated crops such as alfalfa and corn are grown within the valleys of the major rivers and streams. South of the Missouri River is a mix of rangeland dominated by native vegetation and dryland farming.

There are no natural lakes in the drainage that contain a fishery. There are, however, numerous stock ponds and many are managed as fisheries. The Fort Peck Dredge Cuts also have a fishery and are a series of lakes connected to the Missouri River, which were created by the hydrologic dredging that occurred with the construction of Fort Peck Dam. The Missouri, Redwater and Poplar rivers contain sport fisheries that include a host of native and introduced fishes.

FISHERIES MANAGEMENT

The Missouri River downstream of Fort Peck Dam holds a diverse assemblage of both native and non-native fish species. Its proximity to the county seats of Glasgow and Wolf Point make it a popular fishery in northeastern Montana. Native fish species targeted by anglers include sauger, channel catfish, shovelnose sturgeon, burbot and paddlefish. Anglers also pursue a number of nonnative game fish species including walleye, northern pike, and rainbow trout. The Missouri River is managed as a wild fishery, with no stocking of game fish currently taking place.

However, in the past, the Missouri River was stocked with a multitude of species for angling purposes. These past stocking practices in the river, along with current stocking practices in reservoirs, have significantly influenced the current fish assemblage. Currently, water bodies such as Fort Peck Reservoir and smaller ponds that are at times connected to the Missouri River are stocked with **nonnative** species, including, walleye, Chinook salmon, northern pike, yellow perch and largemouth bass. **Today**, this reach of the Missouri River is home to over 50 species of fish, which consists of at least 31 native species and a minimum of 19 nonnative species.

Angling on the Missouri River occurs year-round with the spring and summer months being the most popular. Although ice fishing does occur on the Missouri River, it is limited to a few deepwater holes where good ice forms.

Since the Fort Peck Indian Reservation borders a large proportion of the north side of the Missouri River in this drainage, the Reservation and State have the same harvest regulations. Anglers are allowed one daily bag limit, no matter what side of the river you are fishing, and even if they have a state and tribal fishing license. Special harvest regulations are implemented for paddlefish and rainbow trout. Only one paddlefish can be harvested per year and anglers are required to have a yellow tag to fish in the Missouri River downstream of Fort Peck Dam or the Yellowstone River. An archery season for paddlefish occurs in the Fort Peck Dredge Cuts, where anglers are allowed one fish per year and a blue tag is required. The daily bag limit on rainbow

trout downstream of Fort Peck Dam is two fish, instead of the five that are allowed on other regional waters.

The Redwater River runs south to north through McCone and a portion of Dawson County. The Redwater River enters the Missouri River at river mile 1682, across the river from the town of Poplar, Montana. Game fish present include channel catfish, sauger, northern pike and walleye. The Redwater River hosts 21 native and nine non-native species. Some of the non-native, non-game fish include western silvery minnows, plains minnows, sturgeon chubs, flathead chubs, fathead minnows, northern redbelly dace, river carpsuckers, bigmouth buffalo, smallmouth buffalo, shorthead redhorse, white sucker, goldeye and brook stickleback.

Channel catfish and northern pike are popular game fishes that anglers target in the Redwater River. During the spring and early summer, anglers fish for channel catfish and sauger in the lower portion of the Nickwall Road crossing. This crossing is located approximately one river mile upstream from the confluence and precludes fish passage during most seasons in the majority of years and aggregations of channel catfish and sauger occur below the crossing. Eastern District harvest regulations are in place on all portions of the Redwater River.

The Poplar River drainage is situated on the north side of the Missouri River and encompasses portions of Roosevelt, Daniels and Valley counties, as well as Saskatchewan, Canada. The East Fork meets with the Poplar River near the town of Scobey, while the West Fork enters the Poplar River just south of the Fort Peck Reservation, in Roosevelt County. A dam is located on the mainstem Poplar River just north of the Canadian border and has a great influence on the river's hydrograph. In the years before the dam, sauger and walleye were relatively abundant in the upper portions of the Poplar River. However, angler success has diminished since the construction of the Canadian dam. Current knowledge of the fishery is limited.

Several prairie ponds within the drainage are stocked with game fish to provide fishing opportunities. The deeper ponds have been stocked with game fish such as northern pike, yellow perch, white and black crappie, and largemouth bass; these are meant to be self-sustaining. Shallower ponds that have a tendency to winter kill are often stocked with hatchery-produced rainbow trout that are stocked either annually or biannually.

HABITAT

The construction of Fort Peck Dam significantly altered the habitat of the Missouri River. Fort Peck Reservoir acts as both a sediment and nutrient sink for the Missouri River, and therefore delivers sediment-free and nutrient-poor water to the Missouri River downstream of the dam. The dam prevents all fish from migrating upstream. The dam has also greatly altered the natural flow regime of the Missouri River by holding back spring freshets and discharging higher than natural flows during the winter months. Channel-forming flows have been few and far between since the dam closed off the river in 1937. Fort Peck Dam provides hydroelectric power by drawing reservoir water through its penstocks into the powerhouse. The water that is used for power generation comes from the bottom of Fort Peck Reservoir, which is cold year round. During the spring and summer months, this colder water greatly reduces the water temperature of the Missouri River for approximately 180 river miles. Although water temperature does rise with increasing distance from the dam, average water temperatures in the lower Missouri River near

its confluence with the Yellowstone River are 2° F colder than water upstream of Fort Peck Reservoir.

The altered habitat of the Missouri River due to Fort Peck Dam is evident in the presence and absence, as well as the relative abundance, of native fishes. Several species, such as sturgeon and sicklefin chubs, western silvery minnows, channel catfish and stonecats, become more abundant with distance downstream from Fort Peck Dam. Additionally, the growth rates of fish species like sauger, channel catfish and even pallid sturgeon are slower in the Missouri River near Fort Peck Dam when compared to the lower Missouri or Yellowstone Rivers. For some species like channel catfish, water temperatures may stay too cold to even meet their minimum spawning requirements.

Large irrigation and municipal intakes are located on this section of the Missouri River, both in Valley County and on the Fort Peck Reservation. One intake is located south of Wiota and the second near the town of Frazer and Pickthorn Bay. The effect these intakes on fish populations of the Missouri River is currently unknown. In addition, numerous floating irrigation pumps are located on the river. FWP recommends fish screens for these pumps and these are mandated through the local conservation districts.

Two fish passage barriers on the Redwater River likely block fish passage during normal flow periods. The first barrier is located one mile upstream of the confluence with the Missouri River at the Nickwall Road crossing and the other is upstream at the Redwater Road crossing. Although fish passage routinely does not occur at these sites, the high water of 2011 likely passed fish at the Nickwall Crossing since several large river species were captured upstream of the crossing.

The largest habitat alteration to the Poplar River system has been the construction of a dam for a power plant located in Saskatchewan, Canada. This dam has significantly altered the natural flow regime of the Poplar River. In addition, irrigation withdrawals greatly impact the system. There are several periods throughout the year that the Poplar has little to no water flowing at its mouth.

FISHING ACCESS

The majority of the fishing waters in the drainage are situated on private lands. In addition, a large proportion of the Missouri River's north banks are located on Fort Peck Reservation land. While the Missouri River has five fishing access sites throughout its 180 mile course, public access is very limited due to reservation boundaries and access site spacing. In general, access sites are more than 60 river miles apart, too far for day float trips.

The Redwater River winds through mostly private lands and access is difficult. The main access locations are at county bridge crossing right-of-ways. Similarly, the Poplar River runs through mainly private lands with the majority of access occurring at bridge crossings. A large part of the lower Poplar River is also situated on Fort Peck Reservation lands.

The Fort Peck Dredge Cuts are surrounded by U.S. Army Corps of Engineers land and have good access, including three boat launches. The majority of prairie ponds that FWP stocks within the area are on private land, but landowners allow public access through an agreement with FWP.

SPECIAL MANAGEMENT ISSUES

The pallid sturgeon was listed as endangered in 1990 under the federal Endangered Species Act of 1973. The wild population of pallid sturgeon in the Missouri River downstream of Fort Peck Dam has had no documented natural recruitment since Garrison Dam was closed off in the 1950's. Up until 1998 the entire population was made up of old-aged fish of large sizes. Due to the lack of natural recruitment, propagation efforts commenced in 1997, with the first stocking of pallid sturgeon into the river occurring in 1998. Since that time, thousands of hatchery-reared pallid sturgeon were stocked into the river. The stocking program has been successful in staving off the extirpation of this species in the Missouri River, although habitat alterations to promote natural recruitment have been limited.

The USACE has obligations under the ESA to aid in the recovery of endangered species affected by the operation of Missouri River dams. In the 2000 Missouri River Biological Opinion and the subsequent 2003 amendment to the Biological Opinion, the USFWS listed two Reasonable and Prudent Alternatives that were directed at the operations of Fort Peck Dam relative to pallid sturgeon recovery. One was a spillway test, where warm water would be spilled over Fort Peck Dam's spillway during the spring and early summer to warm the river's water temperature. The second was to examine the potential to selectively withdrawal water out of Fort Peck Dam to increase water temperatures throughout the fish's growing season. Due to a long drought in the Missouri River basin, the reservoir elevations were too low to spill and a test was never accomplished.

However, due to the record setting snowfall on the eastern Montana prairie in the winter of 2010/2011 and the subsequent wet spring, Fort Peck Reservoir filled and the USACE spilled over Fort Peck Dam in 2011. Although this spill event was not designed to elicit a response of pallid sturgeon, it did. During the spring of 2011, up to 40% of the adult pallid sturgeon population moved into the Missouri River in Montana and stayed in the river throughout the spawning season. The migration began to occur when flows were just over 20,000 cfs. During early July an aggregation of adults was found in the Missouri River just downstream of the mouth of the Milk River, which is only one mile downstream of the Spillway channel. A few days later a wild larval pallid sturgeon was collected, which was the first genetically confirmed wild produced pallid sturgeon larvae ever collected in the Missouri River drainage. These results indicate that spring discharge from the Missouri River will trigger wild pallid sturgeon to use the river for spawning and that spawning can be successful.

While successful spawning was confirmed in 2011, it is not known if these fish will recruit to older ages. Past studies have found evidence to support the hypothesis that the drift distance of larval pallid sturgeon could be the limiting factor causing the recruitment bottleneck. Larval pallid sturgeon drift for days after being hatched and with the large reservoirs on the mainstem Missouri, the distance between reservoirs may be too short. However, 2011 was the first time in decades that flows out of the Fort Peck Dam project were sufficient to induce adults to migrate into, and spawn in, the Missouri River, and future discharge events are needed to further evaluate spawning and subsequent recruitment.

FISHERIES MANAGEMENT DIRECTION FOR MISSOURI RIVER - POPLAR DRAINAGE

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Missouri River - Fort Peck Dam to the confluence with the Poplar River	92 miles	Pallid sturgeon	Wild/ Hatchery	Conservation	Restore a self-sustaining population of pallid sturgeon in the Missouri River. Work towards modifying operations at Fort Peck Dam that are beneficial for spawning and growth.
		Paddlefish	Wild	Special Regulations	Continue to allow the unique opportunity for paddlefish snagging in the Missouri River. Monitor the fishery.
		Shovelnose sturgeon, Sauger, Channel catfish	Wild	General	Monitor populations to be certain that overexploitation does not occur. Maintain habitat for all life stages. Better understand how operations of Fort Peck Dam and the Missouri River's tributaries influence production, recruitment and population structure of these native game fishes.
		Rainbow trout	Wild	Special Regulations	Monitor population to make sure overexploitation does not occur. Better understand how angling pressure and harvest may be impacting this species.
		Walleye	Wild	General	Allow harvest to keep population size in check to minimize hybridization with native sauger
		Native non-game fishes	Wild	General	Monitor the native non-game fishes to better understand how operations of Fort Peck Dam and tributaries influence these populations.
Fort Peck Dredge Cuts	542 acres	Paddlefish	Wild	Special Regulations	Continue to allow the unique opportunity for bow fishing in the Dredge Cuts. Improve knowledge relating to the population dynamics of these fish.
		Sauger, Channel catfish Walleye, Northern pike, Burbot	Wild	General	Maintain a quality fishery (size and catch rate) for both native and non-native game fishes. Continue to monitor these populations.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Redwater River	153 miles	Channel catfish sauger	Wild	General	Maintain numbers.
		Native non-game fishes	Wild	Conservation	Protect habitat for native fishes. Provide fish passage at stream crossings.
Habitat needs and activities: Get functional fish passage for all species at the Nickwall Road crossing.					
Poplar River (Canadian border to mouth)	107 miles	Sauger, Channel catfish Northern pike	Wild	General	Begin to understand fish assemblage, population size of game fishes, identify habitat problems.
Prairie Ponds	Various	Yellow perch, Largemouth bass, Northern pike	Wild	General	Continue to monitor these populations and stock fish when necessary. Look for opportunities to increase the quality of habitat by increasing the depth of reservoirs, building new reservoirs, etc.
		Rainbow trout	Hatchery	Put-Grow-Take	Continue to stock prairie ponds with put, grow and take fisheries. Evaluate angler use and evaluate which ponds should be stocked. Look for opportunities to improve habitat where applicable.

LOWER MISSOURI RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Missouri-Big Muddy drainage encompasses approximately 3,750 square miles of land in Roosevelt, Richland, Sheridan and Daniels Counties. The main artery of the drainage is the Missouri River from the confluence of the Poplar River to the North Dakota Border, about 94 river miles. The largest tributary to the Missouri River within the drainage is Big Muddy Creek, which flows from north to south through Sheridan and Roosevelt counties and forms the eastern boundary of the Fort Peck Reservation. Agricultural lands dominate the landscape in the northern portions of the drainage, with grain being the dominant crop. To the south of the Missouri River in its furthest downstream portions, sharp breaks in vegetation occur. Throughout the river bottomlands, irrigated agriculture occurs intermixed with intact cottonwood riparian zones.

Box Elder and Whitetail Reservoirs are the two largest and most fished flatwater fisheries in the drainage and are both located in Sheridan County. Box Elder Reservoir is situated just north of the town of Plentywood, while Whitetail Reservoir is located at the town of Whitetail near the Canada border. Various other smaller prairie ponds located mainly on private land are located within the drainage.

FISHERIES MANAGEMENT

The lower Missouri River, while significantly altered due to the influence of Fort Peck Dam upstream, holds a more naturalized fish assemblage than portions in closer proximity to the dam. Native game fishes such as channel catfish, sauger and shovelnose sturgeon are abundant, as are native non-game cyprinids including sicklefin and sturgeon chubs. The lower Missouri River is an important juvenile rearing area for several species of fish that spawn further upstream in the system. This is the only area of the Missouri River downstream of Fort Peck Dam where young-of-the-year sauger, shovelnose sturgeon and channel catfish are routinely found.

Both wild and hatchery-produced pallid sturgeon are found in higher densities within this section of the Missouri River, when compared to upstream areas. After stocking, hatchery-reared juvenile pallid sturgeon tend to congregate in the lower sections of the Missouri River, most likely due to the higher abundance of native forage fish and more natural temperature and suspended sediment loads. Growth rates of pallid sturgeon and other native fishes are likely higher in this section due to the increased summer water temperatures.

The Missouri River is managed as a wild fishery, with no stocking of game fish currently taking place. However, both past and current stocking practices (in Fort Peck Reservoir) have significantly influenced the current fish assemblage. In the past, upper portions of the Missouri River below Fort Peck Dam were stocked with a multitude of species for angling purposes and many of those fish have colonized the river, including the downstream portions. Today the Missouri River is home to over 50 species of fishes, which consists of at least 31 native species and a minimum of 19 introduced species. Due to the more natural habitat of the lower Missouri River, introduced fishes are less abundant than in portions of the river closer to Fort Peck Dam.

Fishing regulations for the lower Missouri River are similar to that of the upper portions of the river below Fort Peck Dam with general Eastern District regulations in place for the majority of species. Special regulations are in place for the reach of the Missouri River from Fort Peck Dam to the mouth of the Milk River. These regulations are in place to protect the limited coldwater fishery that resides in this tailwater reach. Angling on the lower Missouri River occurs year round with the spring and fall months being the most popular. Although ice fishing does occur it is limited to a few deepwater holes where good ice forms.

Big Muddy Creek hosts a wide variety of native and introduced fishes. Little fisheries data have been collected on Big Muddy Creek over the past few decades. Game fish including channel catfish, sauger and walleye are all found in the lower sections of the creek that are connected to the Missouri River. The upper portions of Big Muddy Creek are home to pearl dace, a Montana Species of Concern that is rare in Montana.

Box Elder Reservoir, also known as Bolster Dam hosts a walleye, northern pike, yellow perch and black bullhead fishery. In the past decade several hundred thousand walleye have been stocked into Box Elder Reservoir. While walleye were abundant, the yellow perch fishery crashed to a low in 2009. For the past couple of years walleye stocking has been stopped to try and reestablish the yellow perch fishery. Several thousand adult yellow perch have been transferred into Box Elder Reservoir since 2010 to try and restart the population. A special daily bag limit of 25 yellow perch has been implemented on Box Elder Reservoir.

Anglers fish for walleye in the spring and summer months, while northern pike are currently the main target during the winter. Anglers harvest the occasional trophy northern pike through the ice and often use a spear to do so.

Whitetail Reservoir is a relatively shallow reservoir with maximum depths less than 15 feet. It is prone to winter kill when snow accumulates, and did have a large die off in the winter of 2010/2011. While northern pike were still abundant, yellow perch, channel catfish and rainbow trout were stocked during 2011 to try to rebound from the large winter kill.

Several prairie ponds within the drainage are stocked with game fishes to provide fishing opportunities. The deeper ponds have been stocked with game fish that are meant to be self-sustaining, such as northern pike, yellow perch, white or black crappie, and largemouth bass. Shallower ponds that have a tendency to winter kill are often stocked with hatchery-produced rainbow trout that are stocked either annually or biannually.

HABITAT

While still highly altered from the presence and operations of Fort Peck Dam, the section of the Missouri River in this drainage is much more natural in its physical and chemical properties when compared to upstream reaches. This more natural appearance is mostly due to tributary influence, bank erosion along the river's course and solar radiation. As such, the lower section of the Missouri River is appreciably warmer during the summer and carries much more suspended sediment than its upstream sections. A more natural fish assemblage exists and consists of several native fish that are uncommon closer to the dam.

The lower sections of the Missouri River are the most important juvenile rearing areas for several native game fish within the Missouri River. For that reason, it is important to protect

these areas by providing the oil and gas industry with up-to-date information which will assist in making informed decisions of how to minimize negative impacts to the aquatic environment. Numerous floating irrigation pumps are located along the river. Fish screens on these pumps are recommended by FWP and mandated through the local conservation districts. Recently, applications are being processed to sell water (market water) to oil companies to be used in the process known as fracking. Fracking involves injecting 1-3.5 million gallons of pressurized water into each oil well to shatter the shale and allow the oil to flow freely. Cumulative impacts of water extraction from the Missouri River will be monitored.

Several road crossing occur along the length of Big Muddy Creek. Documenting these crossings and understanding how they may affect fish migrations is of importance. Irrigation withdrawals also impact the habitat of Big Muddy Creek, and during various periods within the year the creek has limited water.

FISHING ACCESS

The north side of the Missouri River from the Milk River to the mouth of Big Muddy Creek is on the Fort Peck Reservation. Off the reservation and further downstream, limited public land is situated adjacent to the river, with a few exceptions of State lands and lands administered by the Bureau of Land Management. Only two public fishing access sites can be found in this 94 mile stretch of the Missouri River, the Culbertson Bridge FAS and the Snowden Bridge FAS. Both sites had boat launches; however during the floods of 2011 the Snowden site was severely damaged and the boat launch is no longer there.

The majority of Big Muddy Creek flows through private land and the western banks of the lower portion are bordered by the Fort Peck Reservation. Access can be found at a few State sections and at county road crossings.

Box Elder and Whitetail Reservoirs are both readily accessible to the public. Box Elder Reservoir is owned by Sheridan County and has two concrete boat ramps. The local Walleyes Unlimited chapter is placing two handicapped accessible fishing piers in the reservoir in the summer of 2012. Whitetail Reservoir is a State FAS and has a gravel boat ramp.

SPECIAL MANAGEMENT ISSUES

The pallid sturgeon was listed as endangered in 1990 under the federal Endangered Species Act of 1973. The wild population of pallid sturgeon in the Missouri River downstream of Fort Peck Dam, which includes the Missouri-Big Muddy Drainage, has had no documented natural recruitment since Garrison Dam was closed off in the 1950's. Up until 1998 the entire population was made up of old aged fish of large sizes. Due to the lack of natural recruitment, propagation efforts commenced in 1997, with the first stocking of pallid sturgeon into the river occurring in 1998. Since that time, thousands of hatchery reared pallid sturgeon have been stocked into the river. The stocking program has been successful in staving off the extirpation of this species in the Missouri River, although habitat alterations to promote natural recruitment have been limited.

The Missouri River within the Missouri-Big Muddy Drainage is critical habitat for rearing pallid sturgeon of all life stages. It has been shown that if pallid sturgeon are going to be able to successfully recruit to the system, the lower portions of the Missouri River will likely be the

nursery habitat. In addition, hatchery-reared juvenile pallid sturgeon that have been stocked into the system are found in greater abundance in this section of the river than in its upstream counterparts. The greater abundance of native cyprinids also makes this an important area for juvenile and adult pallid sturgeon. With a larger food supply and higher summer water temperatures, this is the best place on the river for pallid sturgeon to make a living.

Several native Missouri River fishes including pallid and shovelnose sturgeon, paddlefish and sauger have evolved with a strategy of drifting for several days after being hatched. This life-history strategy coupled with spawning on hard surfaces such as gravel or cobble, make the lower Missouri River the most important rearing area for these fishes. Since very little hard substrate occurs in the lower portion of the river, many native fishes migrate upstream to reaches that contain the desired hard substrates to lay their eggs on. Once their eggs hatch, their larvae drift downstream where they begin freely swimming and feeding. The lower Missouri River has been identified as having the highest densities of young-of-the-year shovelnose sturgeon and sauger. In addition, the lower river is the only place where abundant young-of-the-year burbot have only been found, further supporting the belief that this is a critical rearing area.

Although this is a critically important area of the Missouri River for pallid sturgeon as well as numerous other native fishes, modifications to Fort Peck Dam will need to occur for the river to come closer to reaching its natural carrying capacity. Water temperatures are warmer in the downstream sections, nevertheless they are still colder during the summer months than river temperatures above Fort Peck Dam. Warmer water temperatures would increase the productivity of the system in several ways. Warmer water would likely increase macroinvertebrate production, which is a key food group for numerous species of fish. Additionally, warming up the river would likely extend the fish growing season, which would positively benefit most all of the native species present. Lastly, warmer water would likely increase the survival rates of fishes, since they would spawn earlier and their progeny would go into winter at larger sizes with better condition.

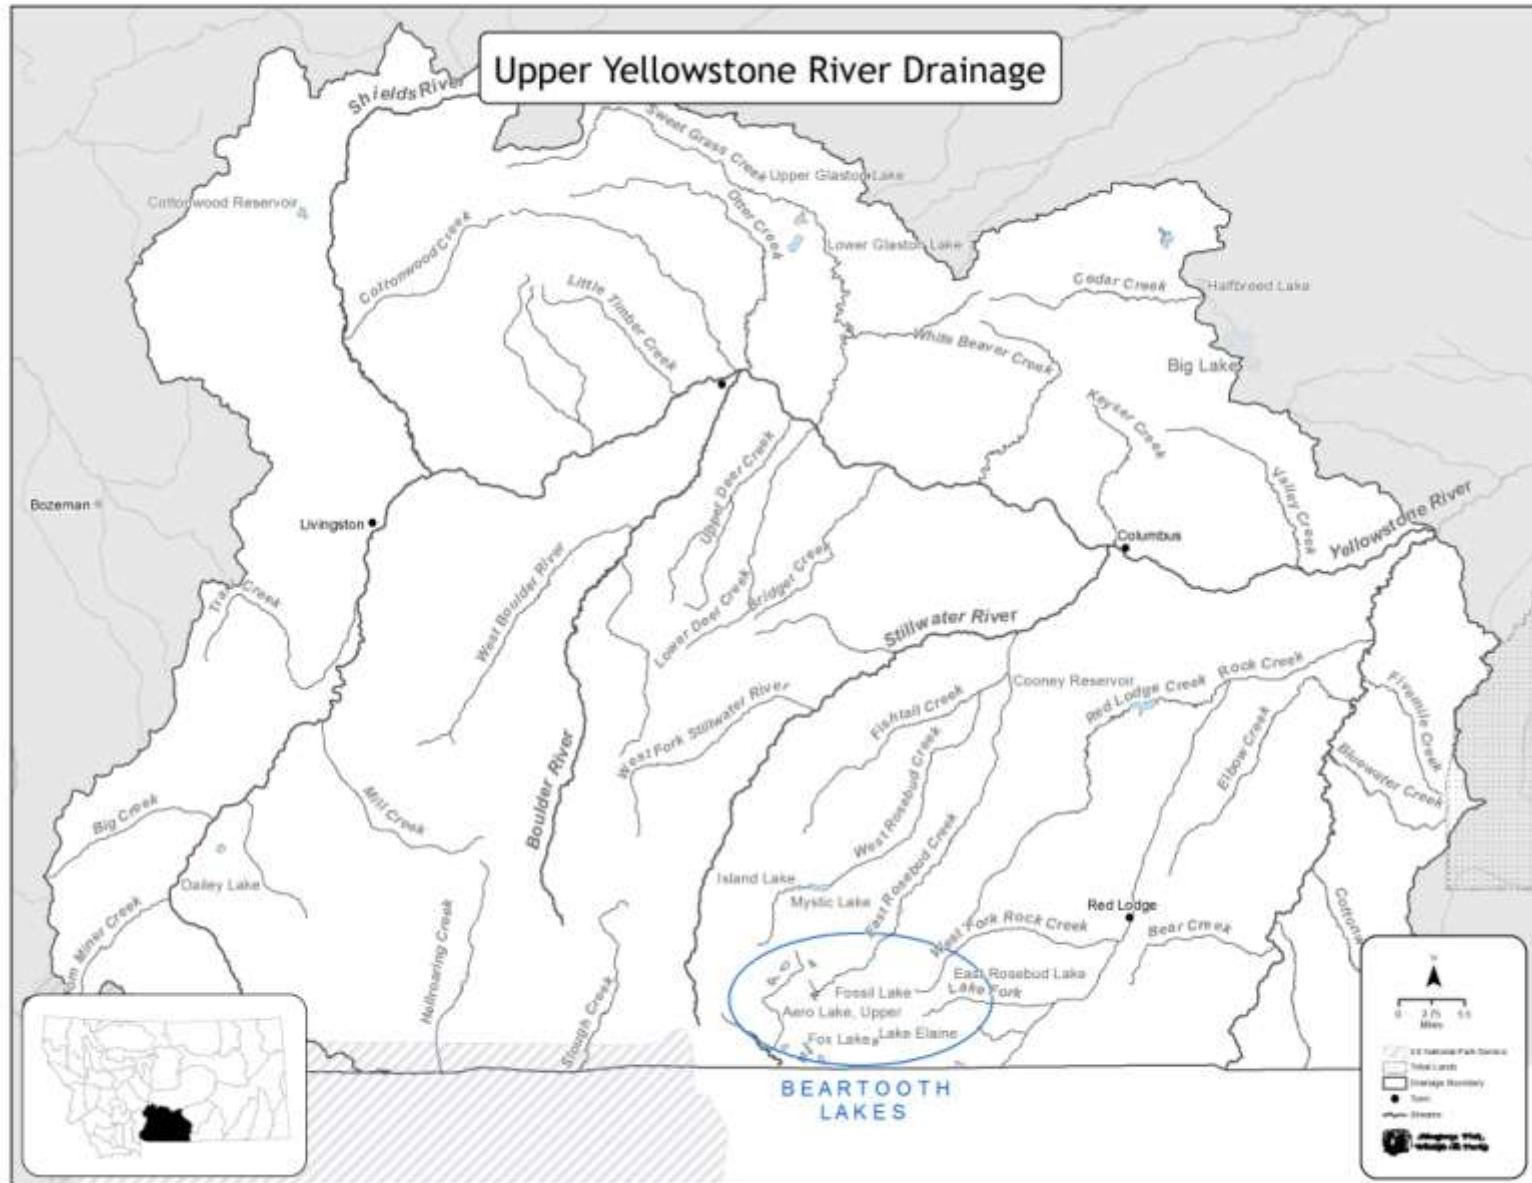

Channel maintaining flows are also needed in the lower Missouri River to create more natural habitats that native fishes utilize. Currently, very few high water events occur in the Missouri, which reduces the complexity of the river which inherently affects native fishes. Spring flows would not only create habitat, but would also elicit a migration and spawning response of many native fishes that currently do not get that trigger often enough.

FISHERIES MANAGEMENT DIRECTION FOR LOWER MISSOURI RIVER DRAINAGE

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Missouri River - Confluence of Poplar River to North Dakota border	94 miles	Pallid sturgeon	Wild/ Hatchery	Conservation	Restore a self-sustaining population of pallid sturgeon in the Missouri River. Work towards modifying operations at Fort Peck Dam that are beneficial for spawning and growth.
		Paddlefish	Wild	Special Regulations	Continue to allow the unique opportunity for paddlefish snagging in the Missouri River. Monitor the fishery.
		Shovelnose sturgeon, Sauger, Channel catfish	Wild	General	Monitor populations to be certain that overexploitation does not occur. Maintain habitat for all life stages. Better understand how operations of Fort Peck Dam and the Missouri River's tributaries influence production, recruitment and population structure of these native game fishes.
		Walleye	Wild	General	Allow harvest to keep population size at levels which will minimize hybridization with native sauger
		Native non- game fishes	Wild	Conservation	Monitor the native non-game fishes to better understand how operations of Fort Peck Dam and tributaries influence these populations.
Big Muddy Creek (Canadian border to mouth)	194 miles	Channel catfish Sauger	Wild	General	Maintain numbers. Inventory habitat issues, such as fish passage barriers and unscreened diversions.
		Native non- game fishes	Wild	Conservation	Protect habitat for native fishes. Provide fish passage at stream crossings.
Box Elder Reservoir	77 acres	Yellow perch, Walleye, Northern pike	Wild/ Transfer	General/ Special Regulations	Continue to monitor these populations. Evaluate the yellow perch transfers and the discontinued walleye stocking. Limit harvest of yellow perch until the fishery rebounds.
Whitetail Reservoir	25 acres	Yellow perch, Northern pike	Wild	General	Continue to monitor populations. Stock fish after winter kills. Evaluate balance between yellow perch and northern pike.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/Acres	Species	Origin	Management Type	Management Direction
Prairie Ponds	Various	Yellow perch, Largemouth bass, Northern pike	Wild	General	Continue to monitor these populations and stock fish when necessary. Look for opportunities to increase the quality of habitat by increasing the depth of reservoirs, building new reservoirs, etc.
		Rainbow trout	Hatchery	Put-Grow-Take	Continue to stock prairie ponds with put, grow and take fisheries. Evaluate angler use and evaluate which ponds should be stocked. Look for opportunities to improve habitat where applicable.

UPPER YELLOWSTONE RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Upper Yellowstone River flows for more than 180 miles from the Montana/Wyoming border to the mouth of the Clarks Fork of the Yellowstone, through Park, Sweet Grass, Stillwater and Yellowstone counties. This section of river, referred to here as the Upper Yellowstone Drainage, supports a quality coldwater fishery in relatively unaltered habitat. The Upper Yellowstone is free flowing, with no dams or river-wide diversion structures present. Most of the river flows through range and crop land traditionally managed for agriculture, but faced with increasing pressure from residential development. Towns and cities along this reach of the Yellowstone include Gardiner, Livingston, Big Timber, Columbus, and Laurel. Significant recreational river use also comes from the population centers of Bozeman and Billings.

Several large tributaries flow into the Upper Yellowstone River, including the Shields, Boulder, Stillwater and Clarks Fork. Numerous smaller, coldwater tributaries flow into the river upstream from Livingston, while a mix of coldwater streams draining from nearby mountains (Bridgers, Bangtails, Gallatins, Crazies, Absarokas, and Beartooths), and warmer water prairie streams enter the Yellowstone between Livingston and Laurel. In total, there are approximately 3,200 miles of fish-bearing stream occurring within 433 streams within the drainage. Additionally, there are 524 lakes, totaling 10,516 surface acres.

FISHERIES MANAGEMENT

The upper Yellowstone River drainage supports a very popular, high quality trout fishery throughout its length. In addition to the fishery of the mainstem Yellowstone, many of the tributaries provide high quality trout fisheries. Above Livingston, the Upper Yellowstone provides a popular sport fishery for rainbow trout, brown trout and Yellowstone cutthroat trout. The tributaries support Yellowstone cutthroat, rainbow, brown and brook trout fisheries as well. Downstream from Livingston, the mainstem and tributaries of the Yellowstone support high quality fisheries for brown and rainbow trout, but Yellowstone cutthroat trout numbers decline moving downstream, and only the occasional cutthroat is caught below Big Timber. Other fish species in the Upper Yellowstone include mountain whitefish and several species of nongame fish, both native and nonnative.

Angling in the Upper Yellowstone River and all major tributaries but the Shields is open year round, but is limited by cold weather and ice in winter and high stream flows during runoff and associated turbid water. Angling on smaller streams is restricted to the period from the 3rd Saturday in May through November 30.

All flowing waters in this drainage that support self-sustaining trout populations are managed as wild trout fisheries, emphasizing habitat protection and natural reproduction. Tributary streams and their connectivity with the Yellowstone are critical for reproduction, as many of the tributaries contain much higher quality spawning habitat than does the Yellowstone River. This connectivity is particularly important for Yellowstone cutthroat trout because their spawning use

of the main stem of the river is limited. Fishing regulations are tailored to protect trout fisheries and satisfy angler demand.

Several lowland lakes and reservoirs, and hundreds of high mountain lakes are part of the Upper Yellowstone Drainage. Two of the lowland lakes, Cooney Reservoir and Dailey Lake, are managed for balanced walleye/trout fisheries via stocking, fishing regulations and other strategies. Dailey Lake is managed for a perch fishery as well. The high mountain lakes are managed to provide maximum angler benefit while minimizing impacts to forest lands and Wilderness, promoting native Yellowstone cutthroat trout restoration, and creating opportunities to catch rare and unique fish species. Fish species in the mountain lakes include Yellowstone cutthroat, rainbow, brook and golden trout, as well as Arctic grayling. Yellowstone cutthroat trout, golden trout and Arctic grayling are stocked in selected mountain lakes on a regular basis. Two mountain lakes, Goose Lake and Sylvan Lake, are brood sources for Yellowstone cutthroat and golden trout that are stocked throughout the state. An important objective of mountain lakes management is to avoid conflicting or compromising fisheries management in streams downstream of the lakes in the same drainage.

Restoration of native Yellowstone cutthroat trout has been a priority in the Upper Yellowstone Drainage. The species has been severely diminished in population size and distribution during human development, and is limited to the upper end of the Yellowstone River and tributaries (above Springdale), and the headwaters of tributaries to the Yellowstone downstream from Springdale. Strategies to protect and restore Yellowstone cutthroat trout populations include maintaining connectivity with spawning tributaries and limiting angler harvest in the upper end of the drainage, and isolating the species using passage barriers to protect it from nonnative trout in tributaries to the lower end of this reach. Several projects in recent years have included building fish passage barriers, chemically removing nonnative trout from above the barriers, and reintroducing cutthroat trout in these streams. These strategies have been successful for recovering several cutthroat trout populations. These new populations have been managed as sport fish: all cutthroat trout in tributaries to the Yellowstone downstream from Springdale are part of an angler's daily trout limit. This regulation strategy has helped build public support for cutthroat trout restoration projects. The long-term goal for cutthroat conservation in the Upper Yellowstone (above Springdale) is to have 20% of the historically occupied habitat restored to cutthroat trout. In the Shields River, upstream from Chadbourn Diversion, the long-term goal for Yellowstone cutthroat trout conservation is to have 100% of the historically occupied habitat restored with secure conservation populations of Yellowstone cutthroat trout.

HABITAT

Although it is the longest undammed river in the contiguous United States and much of the river remains unaltered, significant habitat changes have impacted the Upper Yellowstone River since human settlement. Notable historic development along the Yellowstone River corridor includes the construction of a major railroad, as well as numerous roads to accommodate vehicle travel, including county roads, state highways and more recently a federal interstate highway. All of these developments have, in some way, impacted the river's ability to migrate laterally and interact with its historic floodplain. Using angular rock or concrete rip rap to protect roads, bridges, homes, and farmland or ranchland has restricted the natural expression of the river, and possibly the quality of fish habitat in the river. Significant development is ongoing and may

accelerate along the Yellowstone, particularly in the form of residential housing, which may further impact habitat.

An adequate quantity of cool, oxygenated water is necessary for survival and growth of trout in the upper Yellowstone River. The Yellowstone, Shields, Stillwater and Boulder rivers are all considered priority waters under FWP's drought policy and face potential fishing closures during severe drought conditions that can occur in late summer. In addition to these waters, Rock Creek and the Clarks Fork of the Yellowstone are both severely dewatered from irrigation in specific areas on certain years. Trout populations in these waters can be expected to fluctuate over the years in response to water availability. Other small tributaries in the drainage can also be impacted by irrigation withdrawals.

The operation of irrigation diversions and ditches in the Upper Yellowstone Drainage leads to the entrainment of hundreds of thousands, if not millions of fish each year. Many of these fish are returned or are able to swim back to the stream when ditches are shut down, but many others become stranded and die. Fish screens are uncommon in the area due to their high cost and need for maintenance, troubles with functionality, and overall lack of acceptance by the ranching community. Other alternatives to fish screens are being explored.

Numerous irrigation diversions in the Clarks Fork of the Yellowstone serve as barriers to upstream passage of certain fish species, particularly burbot. Lack of fish passage and low water appear to have impacted the burbot population in the Clarks Fork.

Overall, water quality is good in the upper Yellowstone. Whirling disease has been confirmed in rainbow and Yellowstone cutthroat trout in the middle portion of the drainage, but has not been found in the lower end, despite intensive testing.

FISHING ACCESS

Almost 30 FASs are located on the Yellowstone River between Gardiner and Laurel. The majority of these sites are concentrated on the upper end of the river, where angler use is highest. There are also several additional sites available to the public that are not under FWP ownership or management. The area of the upper Yellowstone most lacking in fishing access is the reach between Columbus and Park City, approximately 20 river miles long. This reach has been a top priority for future access sites.

The Stillwater River has nine fishing access sites and supports very high recreational use, including commercial rafting operations, numerous angling and recreational floaters, bankangling, and camping. Only two FASs exist on the Boulder River, despite the river boasting a very high quality fishery. Much of the upper Boulder River flows through Forest Service land where there are a number of developed campgrounds and good public access. Four access sites are located on Rock Creek, but these are all grouped in a small area between Red Lodge and Roberts. Only one walk-in fishing access site exists on the Shields River.

East Rosebud Creek, West Rosebud Creek, Big Timber Creek, Sweet Grass Creek and other smaller streams have desirable fisheries but public access is primarily limited to county road crossings and a small number of public sites. Stream access via private land is becoming more difficult and therefore it will be critical to secure public access in these areas.

SPECIAL MANAGEMENT ISSUES

Though angling use appears to be stable over the past decade or so, there has been a marked increase in the use of jet boats and rafts on the Yellowstone, and rafts on the Stillwater. In addition, angling pressure on the Yellowstone appears to be shifting downstream, with anglers from Bozeman and Livingston travelling greater distances to avoid crowds. Some concern has been raised over outfitters and guides who are not locally based beginning to operate farther downstream on the Yellowstone Stillwater rivers. Though overall use in the lower end of this reach of the Yellowstone drainage is relatively low, the apparent upward trend could become a management issue in the future.

FISHERIES MANAGEMENT DIRECTION FOR THE UPPER YELLOWSTONE RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Yellowstone River (YNP to Springdale)	97 miles	Rainbow trout, Brown trout	Wild	Special Regulations	Manage harvest to support quality and sustained angling opportunity. Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth.
		Yellowstone cutthroat trout	Wild	Special Regulations	Maintain catch and release fishery in order to maintain the current population.
		Mountain whitefish	Wild	General	Maintain current populations.
Habitat needs and activities: Maintain current habitat					
Shields River and Tributaries (Upstream of Chadbourne Diversion)	54 miles in mainstem	Rainbow trout	Wild	Suppression	Remove where possible to prevent hybridization with Yellowstone cutthroat trout.
		Brown trout	Wild	General	Determine level of threat of brown trout to YCT. If needed reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted.
		Yellowstone cutthroat trout	Wild	Conservation	Maintain catch and release fishery in order to maintain current populations. Implement project to protect and/or expand current populations.
		Mountain whitefish	Wild	General	Maintain current populations.
		Brook trout	Wild	Suppression	Remove where possible to protect Yellowstone cutthroat trout.
Habitat needs and activities: Work to improve stream flow and water temperatures. Work slated to begin during the fall of 2012 to repair the Chadbourne Diversion and ensure that it is a fish barrier. Selective fish passage options are being pursued, but are dependent on negotiations with neighboring landowner.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Shields River and Tributaries (Downstream of Chadbourne Diversion)	11 miles in mainstem	Rainbow, Brown trout	Wild	General	Manage harvest to support quality and sustained angling opportunity. Maintain present numbers and sizes. Consider increasing angler harvest to reduce numbers if necessary to maintain fish growth.
		Yellowstone cutthroat trout	Wild	Special Regulations	Maintain catch and release fishery in order to maintain the current population.
		Mountain whitefish	Wild	General	Maintain current populations.
Habitat needs and activities: Work to improve stream flow and water temperatures.					
Yellowstone River Tributaries (YNP to Springdale) Except Shields River	1,058 miles	Rainbow, Brown trout	Wild	General	Reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted. Maintain sport fishery in other areas.
		Yellowstone cutthroat trout	Wild	Special Regulations	Maintain catch and release fishery in order to maintain the current populations.
		Mountain whitefish	Wild	General	Maintain current populations.
		Brook trout	Wild	General	Reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted. Maintain sport fishery in other areas.
Habitat needs and activities: Improve habitat (riparian, in-stream, and connectivity) and ensure stream flow in dewatered systems.					
Dailey Lake	206 acres	Yellowstone cutthroat trout, Rainbow trout	Hatchery/ Wild	Put-Grow-Take	Monitor recruitment to spring gill nets and adjust stocking as necessary in order to maintain size and age classes.
		Yellow perch	Wild	General	Monitor size and recruitment to spring gill nets.
		Walleye	Hatchery/ Wild	Put-Grow-Take	Monitor recruitment to spring gill nets and adjust stocking as necessary in order to maintain size and age classes.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Habitat needs and activities: Work to maintain adequate lake elevations and balance trout and warm water fisheries through stocking plans.					
Yellowstone River (Springdale to Clarks Fork)	95 miles	Rainbow trout, Brown trout	Wild	Special Regulations	Manage harvest to support quality angling opportunity.
		Yellowstone cutthroat trout	Wild	Special Regulations	Maintain catch and release fishery in order to maintain the current population.
		Mountain whitefish	Wild	General	Maintain numbers. Attempt to better monitor population abundance, trends and angler harvest.
		Burbot	Wild	General	Maintain numbers. Learn more about population abundance, distribution and habitat use. Attempt to enhance population and manage for limited harvest.
Habitat needs and activities: Improve habitat to support ecosystem function and fish production.					
Boulder River and Tributaries	65 miles in mainstem and 168 miles in tributaries	Rainbow trout	Wild	Special Regulations	Downstream from Hells Canyon: manage harvest to support high quality angling opportunity. Upstream from Hells Canyon: reduce numbers to benefit Yellowstone cutthroat trout
		Brown trout	Wild	Special Regulations	Manage harvest to support high quality angling opportunity
		Yellowstone cutthroat trout	Wild	General	Allow harvest as part of Combined Trout limit for this drainage. Protect populations via habitat projects and removal of nonnatives where opportunities exist. Consider establishing new populations where opportunities exist. Manage for large, interconnected genetically pure population upstream of waterfall barrier near Hells Canyon.
		Mountain whitefish	Wild	General	Maintain numbers
		Brook trout	Wild	Special Regulations/ Suppression	Reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted. Manage for sport fishery with opportunity for high levels of harvest in other areas.
Habitat needs and activities: Reduce entrainment of trout in irrigation ditches. Protect existing trout spawning habitat.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Stillwater River and Tributaries	70 miles in mainstem and 451 miles in tributaries	Rainbow trout, Brown trout	Wild	Special Regulations	Manage harvest to support high quality angling opportunity. Reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted
		Yellowstone cutthroat trout	Wild	Special Regulations/ Conservation	Allow harvest as part of Combined Trout limit for this drainage. Protect populations via habitat projects and removal of nonnatives where opportunities exist. Consider establishing new populations where opportunities exist.
		Mountain whitefish	Wild	General	Maintain numbers
		Brook trout	Wild	General/ Suppression	Reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted. Manage for sport fishery with opportunity for high levels of harvest in other areas.
Habitat needs and activities: Reduce entrainment of trout in irrigation ditches. Protect existing trout spawning habitat.					
	141 miles in mainstem and 229 miles in tributaries	Rainbow trout, Brown trout	Wild	Wild	Manage harvest to support quality angling opportunity
		Yellowstone cutthroat trout	Wild	General	Allow harvest as part of District-wide Combined trout limit. Consider establishing new populations where opportunities exist.
		Mountain whitefish	Wild	General	Maintain numbers. Attempt to better monitor population abundance, trends and angler harvest.
		Brook trout	Wild	General	Manage for sport fishery with opportunity for high level of harvest.
		Burbot	Wild	General	Maintain numbers. Learn more about population abundance, distribution and habitat use.
		Arctic grayling	Wild	General	Maintain numbers. Search for evidence of self-sustaining population in upper tributary reaches.
Habitat needs and activities: Improve fish passage over irrigation diversion dams. Minimize dewatering of lower reaches during drought years. Improve burbot habitat.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Rock Creek and Tributaries	59 miles in mainstem and 274 miles in tributaries	Rainbow trout, Brown trout	Wild	Wild	Manage harvest to support high quality angling opportunity. Reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted
		Yellowstone cutthroat trout	Wild	Conservation	Allow harvest as part of District-wide Combined Trout limit. Protect populations via habitat projects and removal of nonnatives where opportunities exist. Indigenous populations should take top priority. Consider establishing new populations where opportunities exist.
		Brook trout	Wild	General/Suppression	Reduce numbers where Yellowstone cutthroat trout are potentially impacted. Manage for sport fishery in other areas.
Habitat needs and activities: Reduce entrainment of trout in irrigation ditches. Protect existing trout spawning and rearing habitat. Minimize large scale human-caused stream channel alterations. Minimize dewatering of certain stream reaches during drought years.					
Cooney Reservoir	733 acres	Rainbow trout	Hatchery	Put-Grow-Take	Evaluate stocking and harvest regulations to optimize number stocked, size of fish and angler catch rate throughout the year.
		Walleye	Wild/Hatchery	Put-Grow-Take	Continue monitoring to ensure adequate natural reproduction to support fishery. Stock if natural reproduction is inadequate. Maintain balance between walleye numbers and forage base.
		Burbot	Wild	General	Consider adjusting harvest regulations to improve fishery. Manage harvest to support quality angling opportunity and maintain forage base. Continue monitoring population as it continues to become established.
		Brown trout	Wild	Wild/General	Maintain numbers.
		Yellow perch, black crappie	Wild	Wild/General	Maintain numbers. Continue monitoring. Consider habitat improvement projects if increase in numbers is deemed beneficial.
Habitat needs and activities: Explore adding shoreline/shallow water habitat structures to improve survival of forage fish, sport fish and crayfish.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Yellowstone River Tributaries (Springdale to Clarks Fork) Except Stillwater, Boulder, Clarks Fork	540 miles	Rainbow, Brown trout	Wild	General	Reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted. Maintain sport fishery in other areas.
		Yellowstone cutthroat trout	Wild	General	Allow harvest as part of District-wide Combined Trout limit. Protect populations via habitat projects and removal of nonnatives where opportunities exist. Consider establishing new populations where opportunities exist.
		Mountain whitefish	Wild	General	Maintain numbers.
		Brook trout	Wild	General	Reduce numbers/prevent invasion where Yellowstone cutthroat trout are potentially impacted. Manage for sport fishery with opportunity for high levels of harvest in other areas.
Habitat needs and activities: Improve habitat to support ecosystem function and fish production.					
Beartooth/Crazy Mountain Lakes	687 lakes and 9,318 acres	Yellowstone cutthroat trout	Hatchery/ Wild	Put-Grow-Take	Maintain numbers. Monitor self-sustaining lakes to ensure population persistence. Continue stocking lakes currently stocked and managed for quality fish size quality. Adjust stocking rates as needed. Consider stocking in lakes containing rainbow and/or golden trout where genetic swamping would be consistent with YCT populations downstream in the drainage.
		Brook trout	Wild	General	Maintain numbers in most lakes. Reduce densities in lakes where it will benefit individual fish growth. Reduce numbers where YCT populations are potentially threatened.
		Rainbow trout	Wild	General	Reduce numbers and genetic contribution in drainages where YCT restoration is a priority.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Golden trout	Hatchery/ Wild	Put-Grow-Take	Maintain numbers in most lakes through stocking and natural reproduction. Reduce numbers in areas where priority YCT populations are potentially threatened.
		Arctic grayling	Hatchery/ Wild	Put-Grow-Take	Maintain numbers. Explore opportunities to provide angling opportunities in more lakes. Consider planting in lakes that contain other fish species to provide multi-species angling opportunity.
Habitat needs and activities: Explore adding spawning gravel to lakes where natural reproduction is desired.					
All waters	3,200 miles of stream	Nongame species (native and nonnative)	Wild	Conservation	Maintain connected populations, support ecosystem function.

BIGHORN RIVER DRAINAGE

PHYSICAL DESCRIPTION

The water source for the Bighorn River (and its major tributary the Little Bighorn River) begins in Wyoming in the Wind, Shoshone, and Bighorn mountain ranges before entering Montana, where it also receives water draining from the Bighorn Mountains as well as the Pryor Mountains. The Montana portion of the drainage includes a portion of the Shoshone River drainage which drains the south face of the Pryor Mountains (primarily the Sage Creek watershed) and flows into Wyoming, but in turn enters Bighorn Lake in Wyoming. Land ownership in this drainage includes private, Custer National Forest, the Crow Tribe Reservation, BLM, and State of Montana land.

Yellowtail Dam impounds the Bighorn River to form Bighorn Lake, which is the largest body of water in the watershed. This reservoir supports a popular recreational fishery that includes a diverse assemblage of native and nonnative species. Tributaries to the Bighorn River in Montana above the dam include Dry Head, Hoodoo, Pitchfork, Spring, Black Canyon, Big Bull Elk, Little Bull Elk, Porcupine, and Crooked creeks.

The lower Bighorn River begins at Yellowtail Dam, and enters the Yellowstone River 86 miles downstream. Tributary streams of the lower Bighorn River include the Little Bighorn River, Rotten Grass Creek, Soap Creek and War Man Creek. Currently, the Bighorn Canal captures the entire flow of War Man Creek within about one mile of its confluence with the river. Lime Kiln Creek is a small stream that enters the Bighorn River just below Yellowtail Dam. Grapevine Creek is an 8-mile long tributary of the Bighorn River that joins the river downstream of Yellowtail Dam.

FISHERIES MANAGEMENT

The Crow Reservation covers a large portion of this drainage. Within the Reservation boundary, the State of Montana has the authority to manage Bighorn Reservoir, Afterbay Dam, and the Bighorn River proper. The Crow Tribe is responsible for management of all other waters within the reservation boundary. Management of tribal waters is not described in this document, except to reference a Memorandum of Understanding that the Crow tribe, several federal agencies, and FWP signed, agreeing to work together to restore Yellowstone cutthroat trout populations in the Bighorn and Pryor mountain ranges.

Completion of Yellowtail Dam altered the fisheries potential of the Bighorn River. Historically, this river supported a warmwater assemblage of riverine species. The hypolimnetic release of cold, clear, nutrient-rich water now supports a world-class tailwater fishery for rainbow and brown trout. The Bighorn River rainbow and brown trout fishery is found from Fort Smith to Hardin. The Bighorn River fishery downstream of Hardin transitions into smallmouth bass, walleye, sauger, burbot, and channel catfish fishing. Bighorn Reservoir, created by Yellowtail Dam, provides substantial fishing opportunity for smallmouth bass, walleye, sauger, perch, crappie, brown trout, rainbow trout, and burbot. Mountain streams in the Bighorn and Pryor mountains provide fishing opportunity for cutthroat trout, rainbow trout, brown trout and brook

trout. Smaller streams in this reach under FWP management are essentially warm water prairie streams that provide habitat for native minnow communities.

Walleye and sauger management changes are being experimentally implemented in Bighorn Reservoir because of a genetically unique population of sauger in the Wyoming portion of the Bighorn River. In an effort to reduce potential hybridization between these sauger and walleye, FWP initiated stocking sterile walleye (with greater than 90% triploidy) into the reservoir. Additionally, sauger are being spawned in Wyoming and reared at Miles City State Fish Hatchery to be stocked in the lower portion of the Bighorn Reservoir in an attempt to increase abundance of sauger and improve angler catch rates and satisfaction.

Crooked Creek and Piney Creek contain the last aboriginal Yellowstone cutthroat trout in areas managed by FWP in the Pryor Mountains. A few populations of cutthroat can also be found in the Pryor and Bighorn Mountains within the Crow Reservation. A memorandum of understanding is in place with the Crow Tribe, BLM, USFS, USFWS, and FWP to recover cutthroat and to assist each other when possible for restoration projects. Sage Creek was a recent cooperative interagency project where brook trout and rainbow trout were removed and replaced with cutthroat. Currently the agencies and the Crow Tribe are in the process of confirming that this project was completed successfully. This fishery will be managed as a recreational fishery with harvest allowed.

The Bighorn River drainage falls under the Central District fishing regulations. Bighorn Reservoir regulations are developed cooperatively between FWP and the Wyoming Game and Fish Department. This cooperation helps to keep the regulations similar in both states for the same water body. Regulations differ from the Central District standards for bass, shovelnose sturgeon, sauger, walleye, catfish, and ling in Bighorn Reservoir. The Bighorn River regulations have specific sauger regulations that differ from the standard regulation. Other regulation exceptions include Crooked Creek and Piney Creek, which allow catch and release for cutthroat trout only. Cutthroat in Crooked Creek and Piney Creek are aboriginal, and efforts have been made to maintain and improve these conservation populations of cutthroat. The stream and river fisheries in Pryor Creek, Sage Creek, and Bighorn River are open all year.

HABITAT

The Bighorn River has been the center of water management disputes between Wyoming and Montana stakeholders for nearly a decade. Criteria for water releases from the dam were developed to support the trout fishery downstream in the Bighorn River, and recommendations for reservoir elevations were advocated by the National Park Service and the State of Wyoming. New operating criteria were developed using computer models to improve transparency of water management by the BOR and to better understand hydrologic limitations imposed by varying water supply, reservoir storage, and dam discharge. Operational rules set reservoir drawdown and refill targets based on the shape and volume of inflows, and scheduled dam discharges to balance the often conflicting requirements for fish and recreation in the reservoir and river downstream. Rule curves were designed to reduce reservoir drawdown and improve refill, and optimize river flows (reduce duration of low flows and duration and magnitude of high flows) to benefit the fisheries in the Bighorn River downstream of the dam. It is not possible to prevent all extreme high or low water conditions in either the river or reservoir because of forecasting error and natural variability in annual water supply from snow melt and unpredictable rainfall events.

Side channel habitat in the Bighorn River has been declining since the dam was put in place in 1967 due to lack of high spring flows and sedimentation. A study by the BOR determined the river bed was not substantially degrading, and the side channels were essentially being plugged with sediment at the heads of the channels with subsequent vegetation growth holding the sediment in place. Some channel heads have been identified for excavation with one completed in 2012.

Several habitat projects have been completed recently in tributary systems. A fish barrier to prevent brown trout from occupying Yellowstone cutthroat habitat and range was put in place in Crooked Creek in 2008. A small private irrigation reservoir on Piney Creek was improved by restoring volume and altering water withdrawal from an open pipe to a kettle system, which reduced fish loss to irrigation as well as improved pool habitat. Additionally the BLM placed logs in Piney Creek to improve substrate and cover habitat. Efforts have been made to ensure culverts and other bank projects in Sage Creek are sized and placed properly to maintain fish passage in the upper watershed.

FISHING ACCESS

FWP manages seven FASs along the Bighorn River: Manuel Lisa, General Custer, Grant Marsh, Arapooish, Two Leggins, Mallards Landing, and Bighorn. Because of the popularity of the Bighorn River, additional FASs could improve access and reduce crowding. Two areas of particular interest would be to develop an additional access between Three Mile and Bighorn FASs, and to develop an access near the St. Xavier Bridge.

The Bighorn Canyon National Recreation Area managed by the National Park Service manages access for the river at Three Mile (Lind Access) and Afterbay Dam. Additionally the Park Service manages 2 boat ramps on Bighorn Reservoir at Ok-a-beh, and Barry's Landing in Montana as well as 1 boat ramp on the Afterbay Reservoir. Access is also available in Wyoming for Bighorn Reservoir at Horseshoe Bend. Several more remote access locations managed by the Forest Service and the BLM allow for access on many streams in this management area. Lodge Grass Reservoir provides opportunity for tribal and non-tribal members but it is managed by the Crow Tribe.

SPECIAL MANAGEMENT ISSUES

Fishing contests occur on Bighorn Reservoir for bass, walleye, and carp on. The Bighorn River supports an annual basis an extensive outfitting and guiding industry. The upper 13 miles on the Bighorn River is restricted to non-motorized boats to reduce conflicts between drift boaters and floaters and powered water craft. Several streams in this management area support conservation populations of Yellowstone Cutthroat.

FISHERIES MANAGEMENT DIRECTION FOR THE BIGHORN PRYOR RIVER DRAINAGE

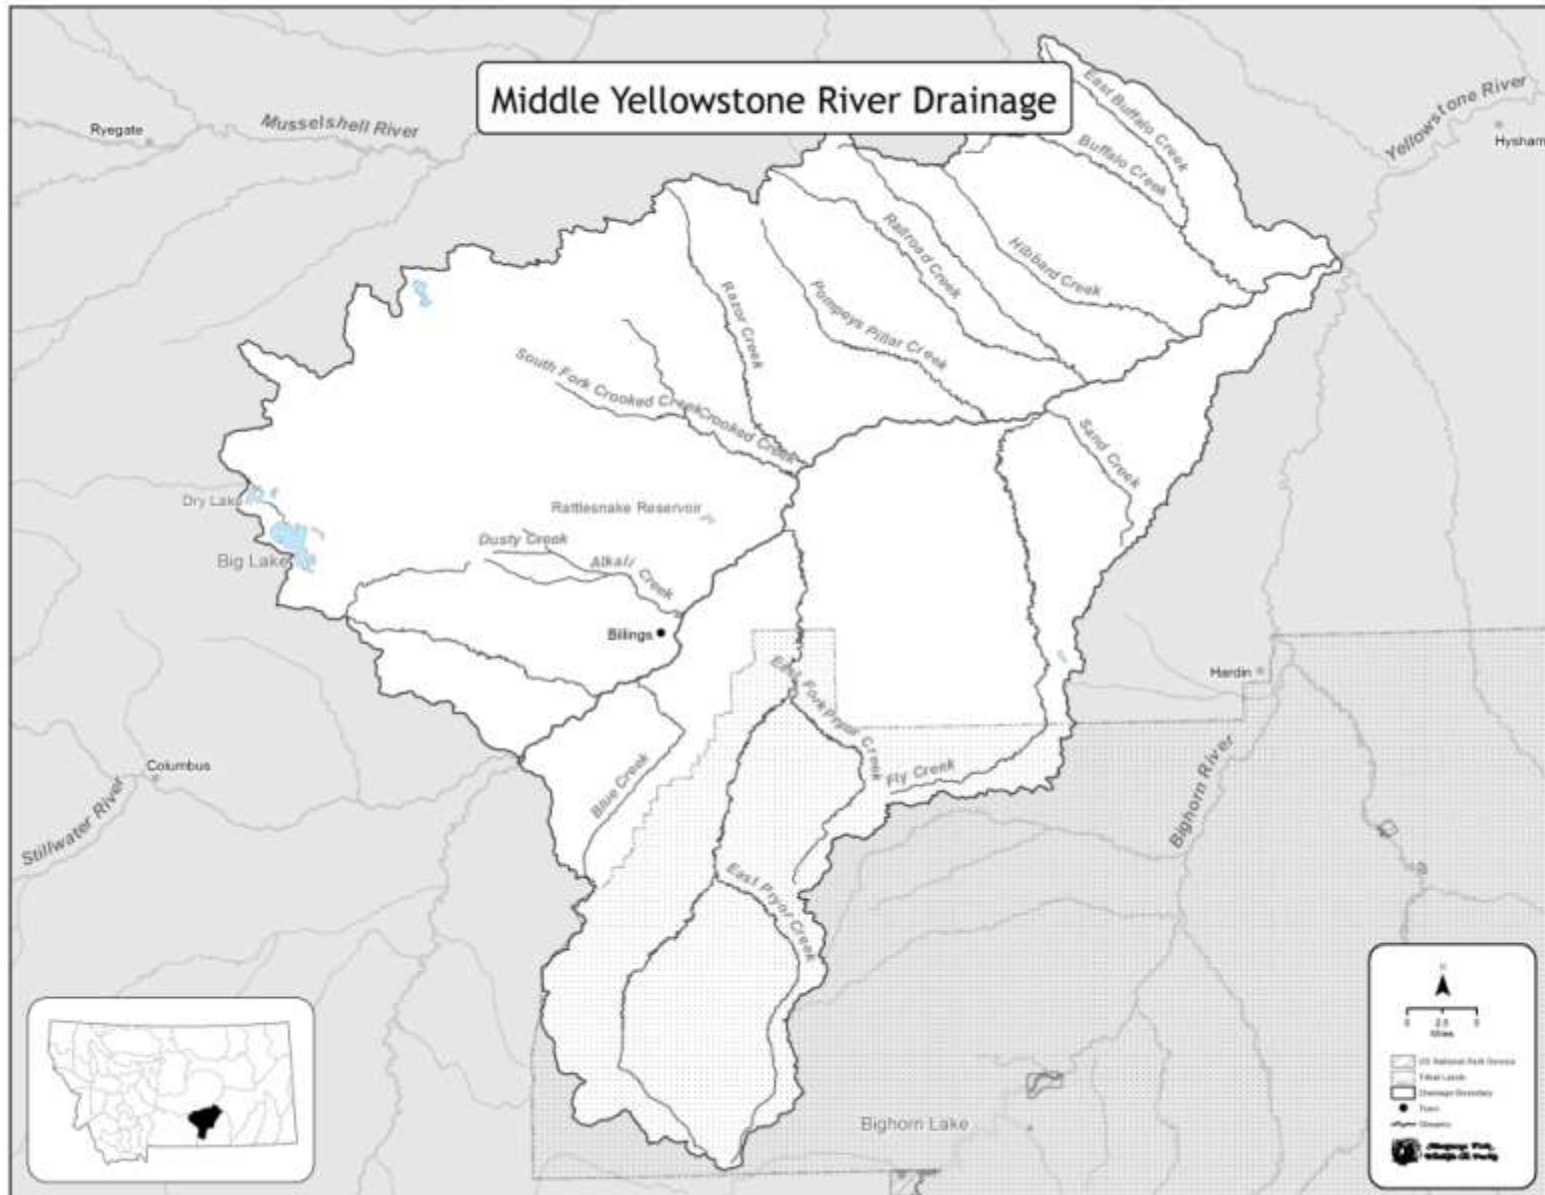

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Bighorn Reservoir (Yellowtail Reservoir)	17,300 acres	Sauger	Wild/Hatchery	Put-Grow-Take/Conservation	Supplemental stocking on experimental basis 2013-2016 in lower reservoir as an effort to improve catch and harvest rates for anglers
		Walleye	Hatchery/Wild	Put-Grow-Take/Quality	Stock only 90%+ triploid fingerling in effort to reduce potential risk for hybridization with unique and pure sauger in the Upper Bighorn River. Provide opportunity to catch walleye with trophy opportunity.
		Smallmouth bass, Yellow perch, Crappie, Brown trout, Channel catfish, Burbot, Carp	Wild	General	Monitor populations over time; rely solely on natural reproduction.
		Rainbow trout	Hatchery	Put-Grow-Take	Monitor populations as necessary.
		Native suckers and minnows	Wild	General	Monitor populations as necessary.
Habitat needs and activities: Make recommendations to BOR for lake elevation management, evaluate sauger and walleye stocking programs.					
Sage Creek	62 miles	Yellowstone cutthroat trout	Wild	Conservation	Establish a fishable population under standard Central District fishing regulations following brook trout removal in 2010-2011.
		Long nose dace, Lake chub,	Wild	Conservation	Ensure these species re-establish following brook trout removal in 2010-2011

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Continued on next page		Fathead minnow Prairie fish assemblage	Wild	General	Maintain populations. Evaluate feasibility of this becoming a source of certified live bait for Bighorn Lake anglers.
Habitat needs and activities: Currently in the process of removing non-native trout and re-establishing cutthroat. Water goes sub-surface frequently once the creek reaches Bowler Flats, several in-channel dams provide refuge for minnow and sucker species, consider efforts to improve habitat. Sage Creek may need some habitat improvement for spawning areas as well as riparian fencing.					
Bighorn Reservoir tributaries (Piney Creek, Dry Head Creek Crooked Creek)	33 miles	Yellowstone cutthroat trout	Wild	Conservation/Special Regulations	Aboriginal populations, no harvest allowed
		Brown trout (Crooked Creek below barrier)	Wild	General/Suppression	Consider reducing or eliminating this and other trout species in the reach from the barrier to the reservoir, and replacing with cutthroat. Most of the reach is in Wyoming and would require a coordinated effort.
Habitat needs and activities: Riparian protection needed as many areas in the Pryor Mountains are overgrazed; many road projects could jeopardize trout populations with perched culverts and increased erosion from road work. Barrier placed in Crooked Creek 2008 may need occasional repair, Habitat improvements in Piney Creek need to be maintained.					
Afterbay Reservoir	176 acres	Rainbow trout	Hatchery/ Wild	Put-Grow-Take	Stock in years when full drawdown isn't conducted. Drawdown is done every 3 years by BOR to evaluate seeps from dam.
Habitat needs and activities: this is a re-regulation reservoir with the potential for 15 vertical feet of elevation change daily, which is a limiting factor to do any substantial fishery management.					
Bighorn River - Downstream of Yellowtail Reservoir	84 miles	Sauger	Wild	Conservation/Special Regulations	Maintain reduced harvest limits, better understand genetic composition. Investigate opportunities for sauger population improvement in the lower river.
		Channel Catfish	Wild	General	Manage as a recreational fishery.
		Burbot	Wild	General	Evaluate population to determine status.
		Mountain Whitefish	Wild	General	Manage as a recreational fishery.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Rainbow Trout, Brown Trout, Walleye, Smallmouth Bass	Wild	General	Manage as a recreational fishery.
		Native non- game species	Wild	General	Improve documentation of abundance and distribution during standard and other sampling efforts.
Habitat needs and activities: Side channel restoration to maintain habitat diversity in the Bighorn to support a variety of fish sizes and species. Flow management activities will be required to ensure the fishery is provided adequate water to maintain the fishery. Gas super saturation in upper river is a recurring problem, look for ways to reduce the cause work with BOR and WAPA to reduce severity if possible. Increased bank stabilization work negatively influences riverine habitats, work with Conservation District and private landowners to find sustainable ways to protect the fishery and property.					
Arapooish Pond	27 acres	Largemouth bass	Hatchery	General	Occasional re-stocking after winterkills
		Carp, Native suckers, Bullheads, Minnows	Wild	General	Fish from the Bighorn River were able to access the pond during flooding in 2011. May need to address in the future if bass are impacted.
Habitat needs and activities: Lake is supported with aeration system to reduce frequency of winterkill, but with more depth the need for air pumps could be eliminated.					

MIDDLE YELLOWSTONE RIVER DRAINAGE

PHYSICAL DESCRIPTION

This reach of the Yellowstone River begins at the confluence of the Clarks Fork of the Yellowstone River and the Yellowstone River just upstream of Billings, the largest city in Montana. It flows west to east approximately 86 river miles to Ranchers Ditch Diversion Dam which is located about 2.5 miles downstream of the mouth of the Bighorn River. Most of this reach is located in Yellowstone County with the lower 2.5 miles in Treasure County. This entire section of river flows through a wide valley with high sandstone bluffs bordering and confining the river on one side or the other through most of the reach. The dominant bluffs are on the south side of the river upstream of Billings and then switch to the north side the rest of the way down. The channel in this section of the Yellowstone is dominated by a cobble and gravel substrate with many islands and gravel bars. Where it can, the river channel is constantly moving within its flood plain.. The railroad right-of-way borders the south side of the Yellowstone River along most of this reach, and in many places the railroad line forms the south bank of the river so the riverbank is heavily armored with large rip rap. The very upper end of this reach is highly urbanized between the cities of Laurel, Billings and Lockwood. As a result, much of the river bank in this section is armored and controlled with rip rap and dikes. A high percentage of the rip rap in this section is concrete rather than rock. Downstream of Lockwood, the river flows past the small towns of Huntley, Shepherd, Pompeys Pillar and Custer.

The Clarks Fork of the Yellowstone enters the Yellowstone River at the upper end of this reach. Two larger tributaries, Canyon Creek from the north, and Pryor Creek from the south enter the Yellowstone in the Billings area. A number of smaller tributary streams enter the Yellowstone from both sides of the valley throughout this section. The only major drainage that feeds into the Yellowstone in this section is the Bighorn River that flows in from the south about 2.5 miles upstream of the lower end of this reach.

The Yellowstone valley is dominated by agriculture growing sugar beets, grains, hay and cattle. As a result, the valley is laced with a network of large irrigation projects that divert a significant volume of water out of the river. Some of these irrigation projects can entrain large numbers of fish. Many of these irrigation systems are designed to use natural tributary streams as waste channels to return excess water back to the Yellowstone River when irrigation demands are lower. This operation can seriously impact flow patterns in these natural streams, cause serious erosion along these stream channels and transport different fish species unnaturally throughout the valley.

Two major low-head diversion dams are present in this section of the Yellowstone with a third structure at the very lower end of the reach. Huntley Diversion Dam is located about 27.4 river miles downstream from the upper end of this reach or about 10 miles east of Billings. It is a concrete-capped weir with a structural height of 10.5 feet and a hydraulic height of 8 feet. This dam spans the entire main channel of the Yellowstone and during normal flow conditions, is an almost complete fish passage barrier for most species of fish found in this section of the river. A seasonal side channel that bypasses the dam to the north side may provide some fish passage especially during higher flows. This side channel merges with the main channel about 3,650 feet

downstream of the dam so fish moving upstream that are blocked by Huntley Dam are unlikely to drop far enough downstream to find this passage around the dam. A fish passage structure was added to Huntley Dam in 1999-2000 when the dam was rebuilt after damage from high water in 1997. This passage was designed to provide passage for warmwater fish species found in this section of the Yellowstone, but the structure was not built as designed, and follow-up studies found that very few fish actually used the bypass structure. Plans are currently ongoing to redesign and rebuild this fish passage so it can pass warmwater fish.

Waco Diversion Dam is located 62.4 river miles downstream from the upper end of this reach. It is another concrete-capped weir that spans the main river channel. It is not as high as Huntley Dam, but still causes a serious high velocity drop off the face of the dam during normal flow conditions, and is likely a fish barrier to most species in the area. Waco Dam has a more developed bypass channel around the dam to the north. This channel maintains better flows during lower water periods than the bypass around Huntley Dam and the downstream connection of the bypass channel to the main channel is closer to the dams so this channel may provide better fish passage than the Huntley bypass channel.

Ranchers Ditch Diversion is located at the downstream boundary of this reach. This diversion consists of two structures spanning both channels at the top of an island. The diversion in the smaller south channel consists of a concrete-capped rubble weir with a well defined dam crest yielding a nearly vertical plunging flow. This structure presents major fish passage issues. The structure on the larger north channel consists of a concrete and rock cap placed over an old steel piling and brush bundle dam. Flow over this section of the diversion is more irregular with a less distinct drop and greater slope. Because flow over the north dam is more like a flow over a steep riffle this section of the dam is probably less of a fish passage barrier than the other diversions in this reach. The irrigation company is constantly working on the north dam, and recent plans to rebuild part of this diversion could increase fish passage issues.

FISHERIES MANAGEMENT

The upper end of this reach on the Yellowstone River represents the transition zone from a coldwater, trout dominated stream to a warmwater stream. Trout numbers drop off rapidly in the upper 27 miles of this reach as cool and warmwater fish numbers increase. The free flowing nature of the Yellowstone River, the natural hydrograph and fairly natural habitat conditions allows the Yellowstone to support and maintain a wide diversity of native and introduced fish species. This reach of the Yellowstone supports approximately 40 different fish species including 28 native species. As a result, this section of the Yellowstone is managed with an emphasis on maintaining the diverse native fishery of both game and nongame species.

The entire reach is managed to provide a diverse recreational fishery for both native and introduced fish with regulations designed to help protect native populations while promoting harvest on nonnative predatory species that can impact native populations. The entire Yellowstone River is managed as a wild fishery with no routine stocking occurring on any section of the river. The upper end of this reach still supports a fairly good rainbow, brown trout and mountain whitefish fishery. As the river transitions into a warmwater fishery below Huntley Dam emphasis shifts to native channel catfish, sauger, and burbot and nonnative smallmouth bass and walleye. Other game species that occasionally show up in this fishery include northern

pike, largemouth bass and crappie. Some nongame species such as goldeye also provide popular angling opportunities.

Special regulations only allowing the harvest of one sauger per day, with a possession limit of two sauger, is designed to protect the limited and genetically unique sauger population in this reach. Cartersville Dam near Forsyth, about 59 miles downstream of this reach has been shown to be a significant barrier to upstream fish movement with a noticeable reduction in sauger numbers and almost total elimination of some species like shovelnose sturgeon upstream of the dam. Channel catfish limits have been reduced statewide to provide additional protection to this long-lived native game fish. All other game species in this reach are managed under standard Central and Eastern district limits. Angling is open year-round on this section of the Yellowstone River although river ice can severely limit the winter fishery most years. Historically, bank fishermen have been the main anglers on this section of the Yellowstone River; but in recent years more and more anglers are using jet boats, which has significantly increased angler use during the spring, summer and fall seasons.

Another important management concern in this section of the Yellowstone River is protection and enhancement of populations of smaller native fishes including numerous minnow and sucker species. These smaller fish provide the main forage base necessary to maintain the populations of larger game fish in the river. In addition, these nongame species are an important part of the diverse native fish fauna that fulfill an ecological role important to the native species management aspect of the middle Yellowstone River.

The majority of tributary streams that feed this reach of the Yellowstone River are smaller prairie streams that provide limited or no recreational angling opportunities. Many of these streams are important to the different life history stages of the various native fish populations in this reach. The Bighorn River is the only major tributary that flows into this reach of the Yellowstone. It enters the Yellowstone approximately 2.5 miles upstream from the lower end of this reach. The Bighorn River is managed as a recreational tailwater trout fishery in the upper end below Yellowtail Dam and transitions into a warmwater fishery before it enters the Yellowstone River.

Several smaller lakes, ponds, and reservoirs including Lake Elmo, Lake Josephine, Laurel Pond and Anita Reservoir, and private ponds with agreements to allow some public access, provide important urban fisheries in the Billings area. These waters are stocked annually with trout as put-and-take fisheries or with largemouth bass, as needed, as put-grow-and-take fisheries. Being close to the largest population center in the state, these waters receive considerable angler use. Good creel data is lacking and needed for these waters. Water levels in some of these lakes are impacted by irrigation demands so it is important to maintain a good working relationship with the associated irrigation districts.

HABITAT

The upper end of this reach represents a transition zone from a relatively clear, coldwater stream to a more turbid warmwater stream. The Clarks Fork drainage at the top of the reach adds considerable sediment to the Yellowstone from early spring runoff until late fall. As the river flows through the city of Billings, heated water from industrial discharges warms up the water temperatures enough that a section of river downstream of town remains ice free throughout the winter except during the most extreme conditions. All of the tributaries that enter this section of

the Yellowstone add turbidity to the river and this turbidity increases during the irrigation season when the different tributaries are flushed with excess water out of the various irrigation ditches. Water temperatures in the upper reach above Billings can reach the mid-70° F range during low water years, while temperatures in the lower end of the reach above the Bighorn River can get into the mid- to high 80s. Flows at the USGS gage at Billings have ranged from a low of 15,200 cfs on May 10, 1934 to a high of 82,000 cfs on June 12, 1997.

This section of the Yellowstone can be affected by the FWP Drought Fishing Closure Policy that requires priority waters, such as the Yellowstone River, be closed to angling if flow or temperature thresholds are reached. Because this section of river represents the transition from cold to warm water habitat on the Yellowstone, past drought closures have normally only extended downstream to the upper end of the warmwater section at Huntley Dam,.

The channel in this reach of the Yellowstone is dominated by boulder and cobble substrate with sediment and sand deposits in slower sections. Where the river isn't controlled by natural bluffs, railroad rip rap, or other man caused bank armoring, it moves fairly naturally within its normal flood plain. River channels are constantly moving and shifting by eroding and laying down new gravel and point bars. Except in the highly urbanized upper section, the riparian zone along this section of the Yellowstone is in fair condition with good cottonwood and willow bottoms. Some agricultural activities extend right to the river's edge, and both Russian olive and salt cedar (noxious weeds) invasions present serious threats to the riparian zone along this entire reach.

Huntley Dam and Waco Dam within the reach, and Ranchers Ditch Diversion at the lower end of the reach, all present fish passage and boat passage issues. These diversions, along with a number of other pump and gravity feed irrigation systems can seriously impact instream flows along this section of the river, and all of them can cause fish loss due to entrainment. FWP has reserved water rights for instream flow with a 1978 priority date on the Yellowstone River. At Billings these reserved rights range from winter flows of 2,483 cfs in January to spring runoff flows of 18,716 cfs in late June. Reserved rights at Billings for the summer and fall irrigation season range between about 3,100 and 4,000 cfs. During low water years, river flows drop below these reservation rights and FWP places calls on water users with rights junior to the FWP 1978 priority date.

FISHING ACCESS

FWP manages 7 FASs along this reach of the Yellowstone River and another site one mile up the Bighorn River that provides boat access to the lower end of this reach. Five of these sites are day use only, while three of them offer overnight camping. A large wildlife management area and associated BLM land located on the north side of the river near the town of Pompeys Pillar provide walk-in access to over five miles of river frontage. Several other publicly owned or managed access points along this section of the Yellowstone provide river access and access for carry-in type boats. Only one of these sites, a county park near Billings, has an actual boat ramp.

Reliable motor boat access is an ongoing concern in this section of the Yellowstone River due to the natural, free flowing nature of the river. Jet boaters are an important and growing user group on this section of river. The constant movement of the river within its flood plain, and the continuing movement and shifting of gravel bars along the river, which help make the river such a unique and important fishery resource, also make it very difficult to maintain permanent motor

boat access along the river. Motor boat use, especially during lower flows, is currently difficult or impossible at several of the existing access sites along this reach, and access changes after each high water event. The highest priorities for new access along this reach would be just up- and downstream of Huntley Dam. In the past it has been possible to boat around Waco Dam through the north bypass channel during most flow conditions. Recent changes in this bypass channel could eliminate boat passage except during high water. Without reliable jet boat passage, additional access above and below Waco Dam would become a high priority. Any potential new access in a relatively stable section of river that can provide reliable ramp access to the river should be considered a high priority.

SPECIAL MANAGEMENT ISSUES

There are several special management issues associated with this section of the Yellowstone River with the most prominent issue being that of native species management. Recent genetic research has shown that the sauger population in this section of the river is genetically unique from any other sauger populations in the remainder of the Yellowstone, Bighorn, or Missouri river drainages in Montana or Wyoming. Additional work is needed to learn more about this sauger population and identify steps necessary to maintain its unique characteristics. Smallmouth bass numbers have greatly increased in this section of the river in recent years. Although they provide a very popular fishery, the impacts this new predator base is having on the native fish populations in the river is poorly understood and needs additional study. Walleye numbers also appear to be increasing in this reach, and their impacts, both as an added predator and their potential hybridization with sauger could impact native fish populations.

The impacts of commercial bait seining on native minnow populations along this section of the Yellowstone River is another major concern. The Yellowstone drainage has become the main source of minnows for a majority of the commercial bait operations throughout eastern Montana. Seiners come from all over eastern Montana to seine the river and tributaries along this reach of the Yellowstone, and this pressure could continue to increase as areas in northeast Montana are closed to seining due to the presence of Eurasian watermilfoil. This seining pressure, especially when combined with increased predation from smallmouth bass and walleye, could have serious impacts on native minnow and sucker populations. Reduction in numbers of these species could seriously impact the native game species that rely on them as forage.

FISHERIES MANAGEMENT DIRECTION FOR MIDDLE YELLOWSTONE RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Yellowstone River (Confluence of Clarks Fork of the Yellowstone River to Ranchers Ditch Diversion)	86.1 miles	Rainbow trout, Brown trout, Mountain whitefish	Wild	General	Manage as a recreational fishery allowing for limited harvest with standard regulations
		Sauger	Wild	Conservation/Special Regulations	Manage sauger populations for limited consumptive harvest with harvest restrictions upstream of Cartersville Dam. Conduct studies to evaluate the importance of the unique genetic character of the sauger population in this section of the Yellowstone. Identify spawning areas and migratory patterns that have helped maintain this genetic uniqueness. Determine value and importance of improving or restricting fish passage in the lower Yellowstone to maintaining this genetically unique population.
		Burbot	Wild	General	Attempt to enhance this burbot population and manage for limited harvest. Identify factors limiting the burbot population in this section of the Yellowstone.
		Channel catfish	Wild	General	Manage as a recreational fishery with emphasis on maintaining a diverse population structure, while providing opportunities to catch larger catfish. Standardize catfish sampling as much as possible in Eastern Montana. Evaluate impacts of recent regulation changes on catfish populations.
		Smallmouth bass	Wild	General	Manage as a recreational fishery with emphasis on harvest. Conduct a study to evaluate the impacts of smallmouth bass on native fish populations in the Yellowstone River.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Walleye	Wild	General	Manage as a recreational fishery with emphasis on harvest.
		Native nongame species	Wild	Conservation	Manage commercial minnow harvest to protect native fish populations. Conduct studies to evaluate and determine habitat and flow needs for native fishes. Work with other permitting agencies to limit impacts of habitat change along the Yellowstone River.
Habitat needs and activities: Improve fish passage for warmwater species at all diversion dams from Intake Dam upstream. Reduce entrainment and loss at head gates and pumps. Maintain or improve instream flows in the river and tributaries. Manage habitat projects to maintain the natural stream functions of a wild undammed river, and evaluate habitat projects based on cumulative impacts.					
Pryor Creek (Downstream of Crow Reservation Boundary)	16.1 miles	Multiple species	Wild	General	Evaluate and improve fish passage issues upstream of the Yellowstone River. Monitor fish movement in and out of the Yellowstone River, monitor spawning success of game and nongame species, and monitor the establishment of resident fish populations in Pryor Creek. Manage Pryor Creek to provide a continuing source of young game fish and forage to the Yellowstone River.
Habitat needs and activities: Improve upstream fish passage now that Pryor Creek has been reconnected with the Yellowstone River. Improve summer stream flows and improve habitat to support ecosystem function and production of native species.					
Yellowstone Tributaries (Smaller Prairies Stream)	42 streams and 290 miles	Multiple native species	Wild	Conservation	Manage commercial minnow harvest to protect native fish populations.
Habitat needs and activities: Evaluate barriers in each tributary and improve fish passage and connectivity with the Yellowstone River. Improve habitat to support ecosystem function and production of native species.					
Lake Elmo	65 acres	Rainbow trout, Yellowstone cutthroat	Hatchery	Put-Take	Manage for maximum recreational use with emphasis on harvest. Adjust stocking rates to provide high catch rates on trout while maintaining reasonable growth rates on stocked fish. Stock with surplus brood fish to support kid's fishing events.
Continued on next page					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Tiger muskie	Hatchery	Quality	Stock a limited number of fish on a 4 year rotation to maintain predation pressure on the sucker population in the lake while providing anglers the opportunity to catch a trophy sized fish.
		Channel catfish	Hatchery	Put-Grow-Take	Stock annually if fish are available to provide an additional opportunity for anglers fishing this popular urban fishery.
Habitat needs and activities: Work with Billings Heights Water on water management for the lake. Limit water level fluctuation during the weekends and ensure the lake is full before the ditch is shut off in the fall. Develop long-term lake management plan to improve fisheries habitat in the lake.					
Lake Josephine	20 acres	Largemouth bass	Hatchery/ Wild	General	Stock every other year to supplement natural reproduction. Promote voluntary catch-and-release on 12 to 15 inch bass.
		Tiger muskie	Hatchery	Quality	Stock a limited number of fish on a 4 year rotation to maintain predation pressure on the sucker population in the lake while providing anglers the opportunity to catch a trophy sized fish.
		Channel catfish	Hatchery	General	Stock annually if fish are available to provide an additional opportunity for anglers fishing this popular urban fishery.
Laurel Pond	18 acres	Rainbow trout, Yellowstone cutthroat trout	Hatchery	Put-Take	Manage for maximum recreational use. Adjust stocking rates to provide high catch rates on trout while maintaining reasonable growth rates on stocked fish. Stock with surplus brood fish to support kid's fishing events.
Habitat needs and activities: Maintain windmills for aeration.					
Anita Reservoir	30 acres	Largemouth bass	Hatchery	General	Stock as necessary to maintain a recreational fishery
Habitat needs and activities: Coordinate with the Huntley Irrigation District to improve long-term water management to benefit the fishery.					

TONGUE RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Tongue River Drainage includes the Tongue River, Hanging Woman Creek, Otter Creek, Pumpkin Creek, Tongue River Reservoir, and numerous stock ponds and prairie streams. Land ownership in the district is mostly private and agriculture is the primary land use practice in the Tongue River watershed with 67,000 acres of irrigated land supporting cattle ranching and farming operations. The Fort Union Coal Formation underlies the watershed. The Tongue River originates on the eastern side of the Big Horn Mountains in north-central Wyoming (Sheridan County) and flows north through Southeast Montana (Big Horn, Rosebud, and Custer counties) to the Yellowstone River. The Tongue River has a drainage area of 5,379 mi², approximately 70% occurring in Montana and 30% in Wyoming. The total length of river in Montana from the state line to its confluence with the Yellowstone River, near Miles City, is 209 miles.

At Decker, Montana, near the Wyoming/Montana border, Tongue River Dam (river mile 189) creates Tongue River Reservoir, a main stem reservoir that can store 79,071 acre-feet of water. In Montana the Tongue River has been divided into five segments by four dams. There are three irrigation diversion dams: (1) Tongue and Yellowstone (T&Y) Diversion Dam at river mile 20; (2) SH Diversion Dam, which is no longer in existence (river mile 51); and (3) Mobley Diversion Dam, which is mostly gone and does not restrict fish passage (river mile 105); and one flood control dam, Tongue River Dam (river mile 189). There is a thermally unique sixth river segment created by hypolimnetic releases out of Tongue River Reservoir. This cold water segment is approximately ten river miles long and ends downstream of the dam near the Rosebud/Big Horn County line (river mile 179).

No natural lakes are found within the drainage. There are, however, numerous stock ponds and some are managed as fisheries with public access and are stocked by FWP. For the rivers and streams, Hanging Woman Creek, Otter Creek, and Pumpkin Creek have game fish that include native and introduced species.

FISH MANAGEMENT

The Tongue River and its tributaries are home to many warmwater and a few coldwater fish species. Native fish species include; sauger, shovelnose sturgeon, channel catfish, burbot, freshwater drum, goldeye, smallmouth buffalo, bigmouth buffalo, blue sucker, river carpsucker, shorthead redhorse sucker, white sucker, longnose sucker, longnose dace, creek chub, lake chub, brassy minnow, fathead minnow, sturgeon chub, flathead chub, western silvery minnow, sand shiner, emerald shiner, and stonecat. Common carp, plains killifish, black bullhead, yellow bullhead, and green sunfish are introduced species that can be found in parts or all of the Tongue River drainage. Largemouth bass, smallmouth bass, walleye, white crappie, black crappie, northern pike, yellow perch, rock bass, pumpkinseed, and spottail shiner have been stocked or illegally introduced in Tongue River Reservoir. Brown and rainbow trout have been stocked in the Tongue River in the tail water below Tongue River Dam.

Trend electrofishing is conducted on six reaches of the Tongue River each year to assess the current relative abundance, population structure, and body condition of fish populations in the Tongue River and monitor changes over time. Trend sampling on Tongue River Reservoir includes gillnet, trap net, and seining methods and is conducted to assess catch rates, condition, and length frequency of game fish in the reservoir. Stock ponds are sampled at least every three years to evaluate the status of the fisheries and ensure a catchable stock of fish is present.

A variety of fish species are available for stocking into ponds and the Tongue River Reservoir from FWP hatcheries including walleye, rainbow trout, smallmouth bass, and largemouth bass. Catchable size trout are stocked annually in the coldwater stretch of the Tongue River below Tongue River Reservoir. The statewide wild fish transfer policy allows regional staff to transfer a variety of species from source ponds with good populations to receiving ponds with fisheries that have suffered due to winterkill or drought. Species stocked in this way include northern pike, yellow perch, black crappie, white crappie, and bluegill.

The Tongue River drainage offers many public ponds and private ponds with public access that are managed as a fishery in the Regional Pond Fishing Program. The program is offered to landowners as a public relations opportunity to provide a fishery for the surrounding community. As long as the landowner allows free public access to the pond FWP will stock and manage the fishery. Anglers are required to obtain landowner permission each time they want to access the fishery. Rainbow trout, largemouth bass, yellow perch, northern pike and crappie dominate the species available in these systems. The fisheries are inspected at least once every three years to examine population densities and size structures. Populations are established or supplemented when needed through stocking from a state hatchery or by wild fish transfers from another fishery within the region.

There is a reduced limit on sauger in the Tongue River above the reservoir to help preserve a remnant population while still allowing for some consumptive harvest. Overall fishing pressure is relatively low on the Tongue River due in large part to lack of public access to the river. Twelve Mile Fishing Access Site (river mile 20) is one of the few publically accessible sites on the Tongue River and is a popular destination for local and out of state anglers. Due to crowding issues at Twelve Mile FAS there is a special regulation limiting the number of lines an individual angler can fish. Stock ponds and prairie streams in the Tongue River drainage have fairly low angling pressure. Tongue River Reservoir ranks 30th in the state and 1st in Region 7 for angler pressure. Due to congestion during holiday weekends, weekend fishing tournaments at Tongue River Reservoir are restricted from the week before and after the following weekends: Memorial Day, Fathers Day, Fourth of July, and Labor Day.

HABITAT

The Tongue River has a constrained riparian corridor with much of the floodplain developed for irrigated agriculture. The river above and below the reservoir has more rocky substrates than downstream reaches and is influenced directly by development of the area's coal resources, a major industry in the watershed. Numerous sites in the Tongue River watershed have been permitted for the development of coal bed methane extraction. The extraction of coal bed methane involves pumping methane and groundwater from coal seams. Much of this water, that is high in salt, is discharged into the Tongue River above Tongue River Reservoir.

The upstream end of Tongue River Reservoir has abundant submerged woody vegetation as a result of the dam rebuild in 1998 that raised the water level of the reservoir. The upstream end has increased turbidity as a result of the river influence. The middle to lower end have abundant rocky habitats and increased water clarity. Submerged aquatic vegetation is common in the bays throughout the reservoir.

The approximately ten river miles downstream of the dam, is a thermally unique river segment created by hypolimnetic releases out of Tongue River Reservoir that supports a stocked rainbow trout and naturally-reproducing brown trout population. The Tongue River in the Birney and Brandenburg area is characterized by a dense cottonwood riparian corridor and has deeper holes that are believed to overwinter resident Tongue River fish. Downstream of Brandenburg, irrigation has an increasing influence on instream flows and riparian habitat. Below T&Y Diversion dam, chronic dewatering is a major habitat concern for Tongue and Yellowstone River fishes.

Irrigation diversion dams have been barriers to fish movement and have fragmented fish populations in the Tongue River for the last 100 years. In addition, the irrigation canals are responsible for entraining fish. The T & Y canal has a modified headworks structure with louvers to minimize fish entrainment. The SH diversion dam (removed fall 2009) and the Muggli bypass channel (constructed fall 2008) around T & Y Diversion Dam has provided successful passage of many native fish species upstream and restored some connectivity between the Tongue and Yellowstone Rivers, but water and passage continue to be the primary fisheries needs of the Tongue River.

Although the drainage is predominately rural, habitat changes have impacted the system since human settlement. Developments include the construction of railroads, and roads to accommodate vehicle travel (county roads, state highways and a federal interstate highway). All of these developments have impacted the river and streams ability to migrate laterally and interact with its historic floodplain. The use of rock or concrete rip rap to protect city infrastructure, roads, bridges, homes, and farmland/ranchland has restricted the natural function of the rivers and streams in this drainage. The installation of culverts, fords and dams has similar impacts on the function of the waterways and upstream migration of fish.

The vast majority of private and public ponds in the drainage are limited by water depth. Most have a maximum depth of 10-11 feet which is marginal for overwintering fish during winters with sustained snow accumulations. The severity and prevalence of winterkills has been and can be reduced by installing windmill aerators. Some landowners and the BLM have installed aerators at their expense in order to reduce winterkill occurrences at ponds they own. FWP has refrained from installing aerators because of the time and expenses required to service and maintain the structures.

FISHING ACCESS

There is currently public access to the Tongue River through Tongue River Reservoir State Park and Twelve Mile Dam FAS. Additional limited access is also provided at county bridges and through landowner agreements. Developing more access for ice fishing on the Tongue River Reservoir is a high priority; of particular interest is State land under DNRC management that would provide access to the upper portion of the reservoir. Other high priority areas for

development include sites downstream of Tongue River Reservoir and Twelve Mile Dam FAS that would be within a day's floating distance from those access points. The Birney and Brandenburg reaches, of the Tongue River, would also provide valuable angling opportunity if access was available.

SPECIAL MANAGEMENT ISSUES

Resource management in the Tongue River drainage requires involvement with many agencies, entities, and user groups. Reservoir issues may include involvement with DNRC, the Decker Coal Mine, and adjacent landowners. The Tongue River water users group (representatives from agencies and irrigation districts), Bighorn, Rosebud, and Custer county conservation districts, Northern Cheyenne and Crow Indian Reservations as well as ranchers and farmers are all stakeholders in resource management decisions in the Tongue River drainage. Land use, energy development, and water allocation are special management issues that affect multiple stakeholders in the drainage.

Construction of a Tongue River Railroad has been proposed to facilitate increased coal extraction available from opening Otter Creek coal mine and expansion of Decker and Spring Creek coal mines. The railroad would be constructed along the banks of the Tongue River for much of its course.

Securing appropriate instream flow rights is a special management concern for the Tongue River. The lower stretch of the Tongue River downstream of the T & Y diversion dam is chronically de-watered. Instream flow needs have been determined by FWP for sauger, shovelnose sturgeon and channel catfish in the Tongue River. These species need a minimum of 190 cfs in the river in the months of September to February, 525-600 cfs from March through June to facilitate spawning runs and rearing, and 225 cfs from July to August. Securing adjudicated water rights for instream flow in the Tongue River according to these guidelines is a special management concern.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

FISHERIES MANAGEMENT DIRECTION FOR TONGUE RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Tongue River - Wyoming State Line to Tongue River Reservoir headwaters	10 miles	Sauger	Wild	Conservation/ Special Regulations	Reduced daily bag and possession limit implemented to protect remnant population.
		Channel catfish	Wild	General	Maintain fishery through regulations.
		Smallmouth bass, Walleye	Wild	General	Maximize harvest and fishing opportunity to reduce competition with sauger.
		Multi species	Wild	General/ Conservation	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Habitat needs and activities: Dewatering is a threat to game and nongame fish, work with Wyoming adjudication process to evaluate Interstate water compact interpretation.					
Tongue River Reservoir	3700 acres	Black crappie, white crappie	Wild	Special Regulations	Manage for recreational family fishing opportunity for crappie. Because of congestion during holiday weekends tournaments will be restricted from the week before and after the following weekends: Memorial Day, Fathers Day, Fourth of July, Labor Day.
Sauger		Wild	Conservation/ Special Regulations	Reduced daily bag and possession limit to protect remnant population	
Walleye		Hatchery	Put-Grow-Take	Manage as recreational fishery with emphasis on harvest. Maintain population through annual stocking to provide additional fishing opportunity.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Smallmouth bass, Largemouth bass, Channel Catfish Northern pike, Yellow perch	Hatchery/ Wild	General/ Put-Grow-Take	Maintain fishery through regulations and stocking.
Habitat needs and activities: work with reservoir operators to regulate water levels with consideration for fishery benefit.					
Tongue River - Reservoir tailwater to Yellowstone River	189 miles	Sauger, Channel catfish	Wild	General	Maintain fishery through regulations and habitat projects
		Rainbow trout	Hatchery	Put-Take	Put and take fishery to maximize fishing opportunity in a thermally altered stream reach
		Brown trout	Wild	General	One time stocking to establish self sustaining population in order to maximize fishing opportunity in a thermally altered stream reach
		Shovelnose sturgeon	Wild	General	Monitor usage of Tongue River and potential for species to successfully utilize Muggli Bypass and reestablish upstream portion of Tongue River.
		Blue sucker, Sturgeon chub	Wild	Conservation	Montana Species of Concern, monitor use and potential for spawning activity in Tongue River. Continue to monitor passage of blue sucker through the Muggli Bypass and use of river upstream.
Continued on next page		Walleye, Smallmouth bass, Northern pike	Wild	General	Maximize harvest and fishing opportunity to reduce competition with sauger.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Multi species	Wild	Conservation/ General	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Habitat needs and activities: Work with reservoir operator to manage water releases to mimic natural hydrograph and manage flow to avoid stranding fish. Reduce fish entrainment into irrigation intakes. Maintain/restore river ecosystem health and function by minimizing or removing stream bank stabilization projects thereby decreasing channel confinement.					
Intermittent Streams: Hanging Women Creek, Otter Creek, Pumpkin Creek Ephemeral Streams: 9 with documented fish populations	48 miles 103 miles 171 miles Various	Multi Species	Wild	General/ Conservation	Maintain fishery through habitat protection and restoration. Maintain or increase connectivity. Opportunistic monitor to further understand system and population dynamics.
Habitat needs and activities: Improve fish passage at current restrictions (culverts, fords, dams) and ensure future structures provide for adequate creek flow and fish passage.					
Small Private Ponds/Reservoirs	Various	Trout Bass, Walleye, Northern pike Crappie, Yellow perch, Bluegill	Hatchery Wild/ Hatchery Wild/ Transfer	Put-Take General/ Put-Grow-Take General	Public relations opportunity with landowners to provide local fishing opportunity for rural community. Maintain fishery through regulations and annual stocking. Public relations opportunity with landowners to provide local fishing opportunity for rural community. Maintain fishery through regulations and stocking when necessary. Public relations opportunity with landowners to provide local fishing opportunity for rural community. Provide panfish angling opportunity, supplement population through wild fish transfers when necessary.
Habitat needs and activities: Water depth (ponds less than 12 feet deep) is a common limitation that leads to frequent winterkills; limitation offset by frequent sampling and stocking or wild fish transfers.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Public Trout Ponds: Blacks Sawmill, Mud Turtle, Dean S	1 acre 2 acres 1 acre	Trout	Hatchery	Put-Take	Annual stocking of trout for angler opportunity.
Habitat needs and activities: water depth (ponds less than 12 feet deep) is a common limitation that leads to frequent winterkills; limitation offset by annual stocking.					

POWDER RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Powder River drainage includes the Little Powder River and two intermittent tributaries (Mizpah Creek and Locate Creek) and drains portions of Carter, Powder River, Custer and Prairie Counties. The headwaters of the Powder River and Little Powder River are located in Wyoming. The Little Powder River flows approximately 72 miles from the Wyoming state line before converging with the Powder River. The confluence of the Powder River with the Yellowstone River is approximately 220 river miles downstream from the Wyoming border. Additionally, 550 miles of fish-bearing stream exist within 44 other streams or creeks within the drainage.

The drainage is rural and includes the small community of Broadus. The landscape is dominated by plains grassland complex but includes a large area of shrub grassland. Cottonwood bottoms dominate much of the riparian area. Land ownership includes state and federal lands but is dominated by private property. Agriculture, primarily ranching and secondarily dry land farming dominate the land use. Industrial exploration and development of the following natural resources is also occurring: coal and bentonite mining, natural gas and oil drilling, and wind turbines.

No natural lakes are found in the drainage, however, numerous stock ponds exist and many provide public access are managed as a fishery and stocked by FWP. In addition to the creeks mentioned above there are numerous warm water prairie streams throughout the drainage. Some the prairie streams hold game fish and many host a considerable number of native and introduced fisheries.

FISHERIES MANAGEMENT

The Powder River and tributaries are managed primarily as a general/conservation fishery. No species are being stocked in any of the rivers/creeks in the drainage. The primary management focus for the entire drainage is to improve fish passage where current restrictions exist (culverts, fords) and ensure future structures provide for adequate stream function and fish passage.

Fish sampling within the drainage has been limited and sporadic. The infrequent sampling that has occurred utilized electrofishing and seining gears. Much of the recent sampling has been associated with a larger scale prairie fish sampling effort and specific educational activities for school programs. Due to low fishin pressure in the drainage there are no specific management goals. .

Like other prairie stream systems the fish assemblage in the Powder River drainage is largely dominated by native species. The Powder River hosts three game fish, channel catfish, sauger, and shovelnose sturgeon. Saugers are classified as a Species of Concern in Montana. In addition to the game fish, 27 native fish species and nine introduced fish species are present in the Powder River. Channel catfish are the only game fish inhabiting the Little Powder River; however, 16 native fish species and four introduced fish species reside within its waters.

The Powder River drainage does not include any large lakes or reservoirs but does support seven private ponds and four public ponds that are managed as a fishery in the FWP Region 7 Pond Fishing Program. The program is offered to landowners as a public relations opportunity to provide a fishery for the surrounding community. As long as the landowner allows free public access to the pond, FWP will stock and manage the fishery. Anglers are required to obtain landowner permission each time they want to access the fishery. Rainbow trout, largemouth bass, yellow perch, northern pike and crappie dominate the species available in these systems. The fisheries are sampled at least once every three years to examine population densities and size structures. Populations are established or supplemented when needed through stocking from a state hatchery or by wild fish transfers from another fishery within the region.

HABITAT

The Powder River is undammed and exhibits a relatively natural hydrograph. Fluctuations of the hydrograph often consist of rapid but short-duration elevated flows resulting from Wyoming mountain snowpack melt or from local rain events. The basin has a significant percentage of highly erodible soils consisting of gumbo, clay and silt. The landscape within the basin is dominated by rough breaks, badlands and buttes. The combination of highly erosive soils and steep/rough terrain often result in large amounts of suspended sediments within the water column and bed load material dominated by sand and silt. Sediment load of the Powder River has the potential to, and often does, alter water turbidity and substrate of the Yellowstone River downstream of the Powder River confluence.

Many native species in the Yellowstone River evolved with and rely upon increased turbidity as a spawning cue and some of these species concentrate downstream of the Powder/Yellowstone River confluence each spring. Sauger, channel catfish, paddlefish (during high flow years that accommodate passage at the Intake Diversion on the Yellowstone River), and shovelnose sturgeon are four native game fishes that rely upon increased turbidity and have been documented to aggregate below the Powder River confluence. The significance of elevated turbidity and bed load of the Powder River to the native fish species of the Yellowstone River is likely substantial and may be critical to their life history. Prior to construction of Tongue River Reservoir and Yellowtail Dam, the Tongue River and Big Horn River had similar sediment regimes to that of the Powder River. The Powder River is the last large tributary to the Yellowstone River that provides a natural hydrograph with a natural sediment/turbidity regime, thus its significance to the native species is imperative and deserves additional evaluation.

The Powder River drainage is predominately rural and recent major habitat changes are limited. Developments include the construction of railroads, as well as numerous roads to accommodate vehicle travel (county roads, state highways and a federal interstate highway). All of these developments have impacted the river and its ability to migrate laterally and interact with its historic floodplain. The use of rock or concrete rip rap to protect city infrastructure, roads, bridges, homes, and farmland/ranchland has restricted the natural function of the rivers and streams in this drainage. The installation of culverts, fords and dams has similar impact on the function of the waterways and even a greater impact on the upstream migration of fish. Irrigation resulting in the dewatering of the rivers/streams is also a habitat concern within the drainage.

Many of the private and public ponds in the drainage are limited by water depth. Most ponds have a maximum depth of 10-11 feet which is marginal for overwintering fish during winters

with sustained snow accumulations. The severity and prevalence of winterkills may be reduced by installing windmill aerators. Some landowners and the BLM have installed aerators at their expense in attempt to reduce fish winterkill occurrences. The regional Fish, Wildlife and Parks fisheries program has refrained from installing aerators for multiple reasons but mainly because of the time and expenses required to service and maintain the structures.

FISHING ACCESS

There are currently two points of access to the Powder River and one point of access to the Little Powder River. The Powder River Depot provides angler access with undesignated camping and a hand-launch --only near the confluence with the Yellowstone River. The second point of fishing access is the Broadus Bridge FAS (river mile 152) and provides day use only and no boat ramp. The single point of access to the Little Powder River is near Broadus and provides day use only and no boat ramp. This access is located near the confluence with the Powder River. Considering the rural nature of the drainage and limited game species in the streams, fishing pressure is low. Access to fish streams is likely attained through private property access, county road crossings and public land.

SPECIAL MANAGEMENT ISSUES

There are currently no special management issues in the Powder River drainage because of low fishing pressure and limited game species available.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

FISHERIES MANAGEMENT DIRECTION FOR POWDER RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Powder River	220 miles	Sauger, channel catfish	Wild	General	Maintain harvest level, relative abundance, and size structure through regulations.
		Shovelnose sturgeon	Wild	General	Manage as a recreational fishery with some harvest opportunity. Monitor health of this long lived native species.
		Blue sucker	Wild	Conservation	Monitor population and investigate life history and movements.
		Multi species	Wild	General/Conservation	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Habitat needs and activities: Dewatering is a threat to game and non-game fish, work with Wyoming adjudication process to evaluate compact interpretation. Reduce fish entrainment into irrigation intakes.					
Little Powder River	72 miles	Channel catfish	Wild	General	Maintain harvest level, relative abundance, and size structure through regulations.
		Multi species	Wild	General/Conservation	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Habitat needs and activities: Improve fish passage at current restrictions (culverts, fords, dams) and ensure future structures provide for adequate creek flow and fish passage.					
Intermittent Streams: Mizpah Creek, Locate Creek	150 miles 42 miles	Multi species	Wild	General/Conservation	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Ephemeral Streams: 10 with documented fish populations	Various

Rest	1 acre				
Boulware	1 acre				
Habitat needs and activities: Water depths. (less than 12 feet deep) is a common limitation that leads to frequent winterkills; limitation offset by frequent sampling and stocking.					

LITTLE MISSOURI RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Little Missouri River drainage includes the Little Missouri River and two perennial tributaries (Box Elder Creek and Beaver Creek) and drains portions of Carter, Fallon and Wibaux counties. Only a small segment of each tributary exists in Montana and all are tributaries of the Missouri River in North Dakota. The headwater of the Little Missouri River is located in Wyoming and only 104 miles exist in Montana before crossing into North Dakota. The headwaters for the other three tributaries occur in Montana and converge with the Little Missouri River in North Dakota.

The drainage is located in a rural setting which includes three small communities: Ekalaka, Baker and Wibaux. The landscape is dominated by plains grassland complex but includes a large area of shrub grassland and a smaller area of plains forest called the Custer National Forest. Land ownership includes state and federal lands but is dominated by private property. Agriculture, primarily ranching and secondarily dry land farming dominate the land use. Industrial exploration and development of the following natural resources is also occurring: coal and bentonite mining, natural gas and oil drilling, and wind turbines.

No natural lakes are located in the drainage, however, numerous stock ponds exist and many are managed as fisheries with public access. In addition to the creeks mentioned above, there are numerous warm water prairie streams throughout the drainage. Some hold game fish and many host a considerable number of native and introduced fish species.

FISHERIES MANAGEMENT

The Little Missouri River and tributaries are managed primarily as a general/conservation fishery. Walleye are stocked in Beaver Creek and is the only species currently being stocked in any of the creeks/streams in the drainage. However, past and current stocking practices in Montana and North Dakota have influenced the fish assemblage. The primary management focus for the entire drainage is to improve fish passage at existing restrictions (culverts, fords, dams) and ensure future structures provide for adequate stream function and fish passage.

Fish sampling within the drainage has been limited to sporadic and infrequent seining activities associated with a larger-scale prairie fish sampling effort and specific educational activities for school programs. Most of the fisheries data in the drainage has been collected in the last decade. Because fishing pressure is very low, there are no specific management goals or fishing regulations for the drainage.

Like other prairie stream systems, the fish assemblage in the Little Missouri drainage is broad and dominated by native species. The Little Missouri River hosts eleven native fish species, five introduced fish species and only one game species (channel catfish). Box Elder Creek supports sixteen native fish species, five introduced fish species, and three game species (northern pike, channel catfish and sauger). Sauger are classified as a Species of Concern in Montana. Little Beaver Creek contains seven native fish species, three introduced fish species, and two game

species (northern pike and channel catfish). Beaver Creek hosts eleven native fish species, six introduced fish species, and two game species (northern pike and walleye).

The Little Missouri River drainage does not include any large lakes or reservoirs but does have eleven private ponds and thirteen public ponds that are managed as fisheries in the Regional Pond Fishing Program. The program is offered to landowners as a public relations opportunity to provide a fishery for the surrounding community. As long as the landowner allows free public access to the pond FWP will stock and manage the fishery. Anglers are required to obtain landowner permission each time they want to access the fishery. Rainbow trout, largemouth bass, yellow perch, northern pike and crappie dominate the species available in these systems. The fisheries are sampled at least once every three years to examine population densities and size structures. Populations are established or supplemented when needed through stocking from a state hatchery or by wild fish transfers from another fishery within the region.

HABITAT

Although the drainage is predominately rural and major changes have not occurred, habitat changes have impacted the system since human settlement. Developments include the construction of railroads, as well as numerous roads to accommodate vehicle travel (county roads, state highways and a federal interstate highway). All of these developments have impacted the ability of rivers and streams to migrate laterally and interact with their historic floodplain. The use of rock or concrete rip rap to protect city infrastructure, roads, bridges, homes, and farmland/ranchland has restricted the natural function of the rivers and streams in this drainage. The installation of culverts, fords and dams impact the function of the waterways and upstream migration of fish.

The vast majority of private and public ponds in the drainage are limited by water depth. Most have a maximum depth of 10-11 feet which is marginal for overwintering fish during winters with sustained snow accumulations. The significance and prevalence of winterkills has been and can be reduced by installing windmill aerators. Some landowners and the BLM have installed aerators at their expense in order to reduce winterkill occurrences at ponds they own. FWP has refrained from installing aerators because of the time and expenses required to service and maintain the structures .

FISHING ACCESS

Considering the rural nature of the drainage and limited game species in the streams, fishing pressure is extremely low and demand for a fishing access site has not occurred. Consequently development of a fishing access site is a low priority within the drainage. Access for fishing in the streams is probably met through private property access, county road crossings and public land.

SPECIAL MANAGEMENT ISSUES

There are no special management issues in the Little Missouri River drainage considering the low fishing pressure experienced and limited game species available.

FISHERIES MANAGEMENT DIRECTION FOR LITTLE MISSOURI RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Beaver Creek	120 miles	Walleye	Hatchery	General	Annual stocking of walleye for increased angler opportunities.
		Multi species	Wild	General/Conservation	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Habitat needs and activities: improve fish passage at current restrictions (culverts, fords, dams) and ensure future structures provide for adequate creek flow and fish passage.					
Perennial Streams: Little Missouri, Box Elder Creek	106 miles 151 miles	Multi species	Wild	General/Conservation	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Intermittent Streams: Little Beaver	12 miles				
Ephemeral Streams: 28 with documented fish populations					
Habitat needs and activities: improve fish passage at current restrictions (culverts, fords, dams) and ensure future structures provide for adequate creek flow and fish passage.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Small Private Ponds/Reservoirs	Numerous	Trout	Hatchery	Put-Grow-Take	Public relations opportunity with landowners to provide local fishing opportunity for rural community. Maintain fishery through regulations and annual stocking.
		Bass, Walleye, Northern pike,	Wild/Hatchery	General/Put-Grow-Take	Promote opportunity with landowners to provide local fishing opportunity for rural community. Maintain fishery through regulations and stocking when necessary.
		Crappie, Yellow perch, Bluegill	Wild/Transfer	General	Promote opportunity with landowners to provide local fishing opportunity for rural community. Provide panfish angling opportunity, supplement population through wild fish transfers when necessary.
Habitat needs and activities: water depth (ponds less than 12 feet deep) is a common limitation that leads to frequent winterkills; limitation offset by frequent sampling and stocking or wild fish transfers.					

LOWER YELLOWSTONE RIVER DRAINAGE

PHYSICAL DESCRIPTION

The Lower Yellowstone River Drainage includes the Yellowstone River, seven perennial streams (Burns, Rosebud, O'Fallon, Cedar, Cabin, Fox, and Thirteen Mile creeks) and numerous intermittent and ephemeral warmwater prairie streams. No natural fisheries lakes are located within the drainage; however, nine public reservoirs (Castle Rock, Baker, Hollecker, South Sandstone, Gartside, Johnson's, Rattlesnake, Homestead, and Spotted Eagle) and numerous smaller public and private reservoirs and stock ponds are managed for fisheries. The drainage includes all or portions of Big Horn, Treasure, Rosebud, Custer, Prairie, Dawson, and Richland counties.

The Yellowstone River is the largest water body within the drainage. The headwater of the Yellowstone River is above Yellowstone Lake in northwest Wyoming. The Yellowstone River flows north into Montana and continues northeast through central and eastern Montana and crosses into North Dakota approximately fifteen miles prior to its confluence with the Missouri River. The Yellowstone River portion of the drainage consists of 293 river miles between the Bighorn River confluence and North Dakota state line. About 90% of all uses of Yellowstone River water in the drainage is for irrigation; roughly 1.5 million acre-feet of water is used annually. Irrigation pumps, gravity-feed canals without dams, and gravity-feed canals with mainstem low-head irrigation diversion dams (Ranchers, Yellowstone River, Cartersville and Intake) are used to withdraw water for irrigation.

The Lower Yellowstone River Drainage is located in a rural setting that includes multiple small communities (Hysham, Forsyth, Colstrip, Rosebud, Miles City, Terry, Fallon, Glendive, Savage, Crane, Lambert and Sidney). The landscape is dominated by plains grassland complex, but includes a large area of shrub grassland and a smaller area of plains forest. Land ownership includes state and federal lands but is dominated by private property. Agriculture, primarily ranching and secondarily dry land and irrigated farming, dominate the land use. Industrial activities include coal mining at Colstrip and natural gas and oil drilling in Richland and Dawson counties.

FISH MANAGEMENT

The relatively natural hydrograph and intact habitat of the lower Yellowstone River and its tributaries support a rich fish assemblage composed of many warmwater and coolwater species, and a few coldwater species. Native fish species include: sauger, shovelnose sturgeon, pallid sturgeon, channel catfish, burbot, paddlefish, freshwater drum, goldeye, shortnose gar, smallmouth buffalo, bigmouth buffalo, blue sucker, river carpsucker, shorthead redhorse sucker, white sucker, longnose sucker, mountain sucker, longnose dace, northern redbelly dace, creek chub, lake chub, sturgeon chub, brook stickleback, brassy minnow, fathead minnow, plains minnow, flathead chub, western silvery minnow, sand shiner, emerald shiner, golden shiner, and stonecat. Common carp, plains killifish, black bullhead, yellow bullhead, and green sunfish are introduced species that can be found in parts or all of the drainage. Largemouth bass, smallmouth bass, walleye, white crappie, black crappie, northern pike, yellow perch, bluegill, and

pumpkinseed have been stocked or illegally introduced and are found in reservoirs, stock ponds; some species are also established in the Yellowstone River and tributaries. Brown trout, rainbow trout, brook trout, and mountain whitefish inhabit reaches of the Yellowstone River near and upstream of the Bighorn River confluence. Brook trout are also found in four small tributaries of the lower Yellowstone River. All four tributaries are influenced by coldwater releases from large groundwater springs.

A primary fisheries management objective for the lower Yellowstone River is monitoring and maintaining the wild and self-sustaining populations of native species. This objective includes maintaining recreational harvest, on a limited basis, for native game species. Another primary objective is monitoring, maintaining and improving the overall ecosystem health of the river. This objective includes monitoring stream bank projects to ensure habitat protection and allowing for natural stream form and function for efficient transport of both water and sediment. A secondary management objective is to maintain a recreational fishery for introduced fish species with an emphasis on harvest.

The lower Yellowstone supports a wild sauger population. Monitoring and sustaining this population for native species preservation and recreational angling is a primary management concern for FWP fisheries staff in Region 7. Annual spring tagging of spawning sauger and subsequent recapture information from department sampling efforts and angler tag returns provides data used to estimate angler harvest and document fish movement. In the Yellowstone River above Cartersville diversion dam there is a reduced limit on sauger because trend data suggest lower relative abundance of sauger upstream of this structure.

The lower Yellowstone River is one of the few places left in North America where anglers can catch and harvest a paddlefish. With technical guidance provided by the University of Idaho, Montana FWP and North Dakota Game and Fish manage the paddlefish population in the lower Yellowstone River cooperatively. Paddlefish management is guided by the 10-year "Management Plan for North Dakota and Montana Paddlefish Stocks and Fisheries." Fish from this population spend most of their lives in the headwaters of Lake Sakakawea. In May and June during elevated Yellowstone River discharge, paddlefish seasonally migrate up the Yellowstone and Missouri Rivers to spawn. During paddlefish season, anglers can fish for paddlefish from the Bighorn River confluence to the North Dakota state line, but most angling occurs at and downstream of Intake FAS. The paddlefish season has a specific set of regulations and management activities designed to ensure that this long-lived, late to mature species can continue to provide sport fishing opportunity in Montana. FWP attempts to maximize angler opportunity while ensuring sustainability with a split season, with harvest-only days and catch-and-release-only days. Data collected from tagging efforts during catch-and-release fishing allows estimation of the population size each year. Data collected from harvested fish allows evaluation of population structure. Together this information allows FWP to monitor the overall size of the population and condition of the individuals within the population through time. A statewide paddlefish telephone creel is conducted annually to obtain a harvest estimate that is compared to the field-measured harvest.

Research activities are conducted to understand and aid recovery of pallid sturgeon, a federally endangered species and state Species of Concern. Recent research includes monitoring adult pallid sturgeon migration pathways and reproduction within the Yellowstone River. The lack of successful natural recruitment prompted the stocking of juvenile hatchery-reared pallid sturgeon

into the Yellowstone River as far upstream as Cartersville diversion dam. These fish are reared by state and federal hatcheries including the Miles City State Fish Hatchery. Annual monitoring of juvenile pallid sturgeon occurs in late summer/early fall to assess the survival rate of hatchery-stocked pallid sturgeon into the Yellowstone River. No angling is allowed for pallid sturgeon because of its endangered species status.

Trend electrofishing is conducted annually on five reaches of the lower Yellowstone River to assess and monitor relative abundance, population structure, and relative condition of all fish species. Trend sections are six miles long and are located at Hysham, Forsyth, Miles City, Fallon, and Intake. Each site is sampled once in the months of August, September, and October. Data collected during this period is the baseline information for monitoring relative abundance and condition of sport fish and native species in the lower Yellowstone River. In the Yellowstone River and tributaries, the primary objective for all fish species is to monitor and sustain a wild fishery. Fish stocking will not occur in a river system unless natural spawning and recruitment are failing or habitat is deemed to be irreparable.

The Lower Yellowstone River Drainage also has many private and public reservoirs and stock ponds that are managed as fisheries in the Regional Pond Fishing Program. The program is used as a public relations opportunity with landowners and provides a fishing opportunity for the surrounding community. If the landowner agrees to allow free public access to the pond, FWP will stock and manage the fishery. Anglers are required to obtain landowner permission every time they access the fishery. Fish populations are established or supplemented when needed through stocking from a state hatchery or by wild fish transfers from another fishery. A variety of fish species are available for stocking from a state operated hatchery including: walleye, rainbow trout, smallmouth bass, largemouth bass, channel catfish and northern pike. The statewide wild fish transfer policy also allows transferring fish between waters. Northern pike, yellow perch, black crappie, white crappie, and bluegill are often available for transfer. Transfers are usually done to re-establish or augment ponds affected by winterkill or to provide forage. Reservoirs and stock ponds are sampled by FWP at least every three years to evaluate the status of the fisheries and ensure a catchable stock of fish is present. A Regional Pond Fishing Guide is generated annually that summarizes the pond program, locations of ponds, and fish species available. The guide is available to the public at the regional office.

Overall fishing pressure is low to moderate in the drainage, but increasing on the Yellowstone River due to increasing numbers of anglers owning riverboats and increased public access. Stock ponds and prairie streams in the drainage have high to low angling pressure. Spotted Eagle Pond in Miles City, Hollecker Lake in Glendive, Baker Lake in Baker, South Sandstone Lake near Baker, Castle Rock Lake in Colstrip, and Gartside Reservoir near Sidney all experience high fishing pressure because of proximity to population centers. Many of the public reservoirs and private ponds in the district get moderate to low angling pressure.

HABITAT

The Yellowstone River, touted as the longest undammed river in the lower 48 states, has a relatively intact and natural hydrograph. Hydrograph fluctuations often consist of short-duration elevated flows in early spring from local snow melt and rain events, but longer, sustained, elevated flows in spring/early summer from mountain snow melt. Historically, two major tributaries that are now dammed (Bighorn and Tongue rivers) provided a significant influence on

the hydrographs and sediment regime of the lower Yellowstone River. Construction of Tongue River Reservoir (on the Tongue River) and Yellowtail Dam (on the Bighorn River) permanently altered the hydrograph and sediment contribution to the lower Yellowstone River.

These anthropogenic habitat alterations are noteworthy because many native species in the lower Yellowstone River evolved and relied upon increased turbidity as a spawning cue. The increased turbidity and fine-grained streambed material may be critical to the life history of native fish species in the lower Yellowstone River. The resulting reduced turbidity creates favorable conditions for introduced species such as smallmouth bass. Prior to construction of Tongue River Reservoir and Yellowtail Dam, the Tongue River and Bighorn River had sediment regimes similar to the Powder River. Sauger, channel catfish, paddlefish (during high flow years that accommodate passage at Intake) and shovelnose sturgeon are four native game fishes that have been documented to aggregate in the high-turbidity waters downstream of the Powder/Yellowstone River confluence. It is probable that similar fish aggregations historically occurred in the Yellowstone River downstream of the confluences with the Tongue and Bighorn Rivers prior to dam construction.

Four low-head diversion dams on the lower Yellowstone River (Ranchers, Yellowstone, Cartersville and Intake) create anthropogenic barriers to upstream fish migrations. The impact on migration is different at each dam. Cartersville and Intake dams are the most significant fish barriers. Native fishes exhibit extensive seasonal migrations that are critical to their life history and to maintaining populations throughout the lower Yellowstone River. Working with irrigation districts to facilitate fish passage at barriers is critical for habitat improvement and is a primary goal for the regional fisheries management program. Designs are currently underway to improve/create fish passage at Intake Diversion Dam.

Entrainment of fishes into unscreened canals is a concern in the drainage. Installation of screens on unscreened structures will prevent or reduce the entrainment of fishes into canals and other irrigation structures. In 2011, a new head gate with screens was completed at Intake canal. A screening structure has also been purchased and will be installed at the Buffalo Rapids Shirley pump site. Both projects have/will reduce the annual entrainment of thousands of fish into these canals.

The lower Yellowstone River riparian corridor provides critical wildlife habitat. It varies from sparse ribbons of trees to robust cottonwood galleries. Much of the floodplain is developed for irrigated agriculture. Other developments include the construction of railroads, as well as numerous roads to accommodate vehicle travel (county roads, state highways and a federal interstate highway). All of these developments have impacted the ability of the Yellowstone River to migrate laterally and interact with its historic floodplain. The use of rock or concrete rip rap to protect city infrastructure, roads, bridges, homes, and farmland/ranchland has restricted the natural function of the Yellowstone River and prairie streams in this drainage. These impacts may extend to the quality of fish habitat in the river. The installation of culverts, fords and dams has similar impacts on the function of the river, tributaries, and prairie streams and even greater impacts on upstream fish migrations.

The Lower Yellowstone River Drainage has some of the deepest ponds and reservoirs in the region, but many private and public ponds in the drainage are limited by water depth. Ponds with a maximum depth of 10-11 feet are generally marginal for overwintering fish during winters with

sustained snow accumulations. The severity and prevalence of winterkills may be reduced by installing windmill aerators. Some landowners and the BLM have installed aerators at their expense in attempt to reduce winterkill occurrences. FWP has refrained from installing aerators because of the time and expenses required to service and maintain the structures.

FISHING ACCESS

In 2012 there are 18 FASs that provide access to the Lower Yellowstone River. There are several private or undeveloped public access points as well. The Yellowstone River upstream of Ranchers diversion dam can be accessed by Manuel Lisa FAS on the Bighorn River. Myers Bridge FAS provides access to the Yellowstone River between Ranchers diversion and Yellowstone diversion. Rosebud West FAS provides access to the Yellowstone River from Yellowstone diversion to Cartersville diversion. Rosebud East FAS, Far West FAS, Roche Jaune FAS, Kinsey Bridge FAS, Bonfield FAS, Powder River Depot FAS, Calypso Bridge (BLM), Fallon Bridge FAS, Black Bridge FAS, Walleyes Unlimited Boat Ramp (Glendive), and Stipek FAS provide access to the Yellowstone River between Cartersville and Intake diversion dams. Intake FAS, Elk Island FAS, Seven Sisters FAS, Sidney Bridge FAS, and Richland Park (Richland County) provide access to the Yellowstone River downstream of Intake diversion dam. There are also a few sites available at county bridge crossings and some landowner agreements that provide limited access. Amelia Island and Stipek FAS's are scheduled to have boat ramps installed. Other high priority areas include securing access in the reaches between the Bighorn Confluence and Forsyth, between Rosebud and Miles City, at the bridge in Terry, and between Fallon and Intake.

SPECIAL MANAGEMENT ISSUES

Resource management in the Lower Yellowstone River Drainage requires involvement with many agencies, entities, and user groups. River issues may include involvement with Department of Natural Resources and Conservation, BLM, FWS, BOR, Army Corp of Engineers, Burlington Northern Santa Fe railroad, Yellowstone River Conservation District Council, local conservation districts, and adjacent landowners. Land use, energy development, and water allocation are special management issues that affect multiple stakeholders in the drainage.

Securing appropriate in-stream flow rights is a special management concern for the lower Yellowstone River. Over-allocation of water in the Yellowstone River drainage is poised to be a major threat to fisheries resources in the next drought cycle. The cumulative effect of irrigation withdrawal and withdrawal for oil and gas hydraulic fracturing is of particular concern. Balancing diverse land and aquatic resource uses while maintaining critical habitat for fish and wildlife is also a special management concern. Maintaining current fish passage and recovering lost fish passage due to anthropogenic influences is a special management concern, especially as irrigation districts begin to update infrastructure. Structures such as Yellowstone diversion dam and Ranchers diversion dam do not currently appear to be significant fish passage barriers, but they have the potential to become major barriers if updated without consideration to fish passage.

Paddlefish management on the lower Yellowstone River includes an annual Memorandum of Understanding and permit for a commercial caviar operation conducted by the Glendive Chamber of Commerce. During the paddlefish season the Chamber has a paddlefish processing facility at the Intake FAS. In exchange for having paddlefish cleaned, anglers donate their

paddlefish eggs to the caviar operation. The 1993 Legislature authorized paddlefish caviar sales by the Glendive Area Chamber of Commerce and funds generated from the caviar sales must be used for a grant program. Funds are available to non-profit entities through grant applications for projects that meet a historical, cultural, or recreational need. The project must show public benefit and funding is not allowed for projects that are for private benefit. Emphasis is on small non-profit groups in Eastern Montana.

Coal development began in the mid 1970's and continues to be a large industrial activity in the Colstrip area. In 2011, the State of Montana also sold its Otter Creek mineral rights to an out-of-state company. The impact of continued coal operations at Colstrip and development of new mines will be a management concern for many years in the drainage. Oil and natural gas extraction from the Bakken and other shale zones is another industrial activity that will have unknown impacts to the drainage. The majority of drilling is focused in the Sidney and Baker areas. Infrastructure for the oilfield, especially pipeline construction, is a secondary product of oil development that will continue to have impacts on the resources of the LYRD. Immigration of people associated with oil development has increased, and will heighten the demand on natural resources and local infrastructure, especially housing. Management of the local FAS and Wildlife Management Areas have become more challenging due to the influx of people, and changes are being considered to limit the use of these sites.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

FISHERIES MANAGEMENT DIRECTION FOR LOWER YELLOWSTONE RIVER DRAINAGE

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Yellowstone River - Confluence of Bighorn River to Cartersville Dam	59 miles	Sauger	Wild	Conservation/ Special Regulations	Manage sauger population for limited consumptive harvest by reduced harvest limits.
		Channel catfish	Wild	General	Manage as a recreational fishery. Standardize catfish sampling methods for comparison across eastern Montana.
		Smallmouth bass	Wild	General	Recreational fishery with an emphasis on harvest. Monitor to evaluate the impacts of smallmouth bass on native fish populations in the Yellowstone River.
		Walleye	Wild	General	Recreational fishery with emphasis on harvest. Monitor to evaluate source of walleye in Yellowstone River to direct management decisions for sauger conservation.
		Multi species	Wild	General/ Conservation	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Habitat needs and activities: Increase fish passage and reduce fish entrainment into canals at Ranchers, Yellowstone, and Cartersville diversion dams and other irrigation intakes. Maintain/restore river ecosystem health and function by minimizing or removing stream bank stabilization projects thereby decreasing channel confinement.					
Yellowstone River – Cartersville Dam to Powder River confluence	88 miles	Sauger	Wild	Conservation	Manage sauger populations for limited consumptive harvest. Monitor threat of hybridization with walleye and direct management decisions that maximize angler opportunity while protecting genetic integrity of the sauger population. Protect critical spawning habitat from Miles City to Glendive.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Continued on next page		Paddlefish	Wild	Special Regulations	Monitor paddlefish usage of this section of river in water years that paddlefish successfully migrate upstream of Intake Dam (on average occurs 2 out of every 10 years).
		Channel catfish	Wild	General	Manage as a recreational fishery. Standardize catfish sampling methods for comparison across eastern Montana.
		Smallmouth bass	Wild	General	Recreational fishery with an emphasis on harvest. Monitor to evaluate the impacts of smallmouth bass on native fish populations in the Yellowstone River.
		Walleye	Wild	General	Recreational fishery with an emphasis on harvest. Monitor to evaluate source of walleye in Yellowstone River to direct management decisions for sauger conservation.
		Shovelnose sturgeon	Wild	General/ Conservation	Manage as a recreational fishery with some harvest opportunity. Monitor health of this long lived native species.
		Pallid sturgeon	Wild	Conservation	Endangered species, harvest prohibited. Conduct research to assist decision making for recovery of species. Increase genetic diversity through stocking following pallid sturgeon recovery plan. Establish fish passage at intake diversion dam and monitor subsequent upstream passage and habitat usage.
		Blue Sucker	Wild	Conservation	Monitor population and investigate life history and movements throughout Yellowstone River.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Multi species	Wild	Conservation/ General	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Habitat needs and activities: Increase fish passage at Cartersville and Intake Diversion Dams and reduce fish entrainment into irrigation intakes. Maintain/restore river ecosystem health and function by minimizing or removing stream bank stabilization projects thereby decreasing channel confinement. Protect critical sauger spawning habitat from Miles City to Glendive. Increase fish passage at intake diversion dam and reduce fish entrainment into irrigation intakes. Maintain/restore river ecosystem health and function by minimizing or removing stream bank stabilization projects thereby decreasing channel confinement. Protect critical sauger spawning habitat from Miles City to Glendive.					
Yellowstone River – Confluence of Powder River to North Dakota State line	134 miles	Paddlefish	Wild	Special Regulations	Intensively monitor population to closely harvest with a harvest target reflective of population trends. Management shared and coordinated through a Montana/North Dakota Management Plan. Annual Memorandum of Understanding between FWP and Glendive Chamber of Commerce for processing of paddlefish and sale of paddlefish roe for funding of a nonprofit community grant program. Increase fish passage at Intake diversion dam to provide additional upstream spawning habitat.
		Pallid sturgeon	Wild/ Hatchery	Conservation	Endangered species, harvest prohibited. Conduct research to assist decision making for recovery of species. Increase genetic diversity through stocking following pallid sturgeon recovery plan. Establish fish passage at Intake Diversion Dam and monitor subsequent upstream passage and habitat usage.
		Sauger	Wild	Conservation	Manage sauger populations for limited consumptive harvest. Monitor threat of hybridization with walleye and direct management decisions that maximize angler opportunity while protecting genetic integrity of the sauger population.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Channel catfish	Wild	General	Manage as a recreational fishery. Standardize catfish sampling methods for comparison across eastern Montana.
		Shovelnose sturgeon	Wild	General/ Conservation	Manage as a recreational fishery with some harvest opportunity. Monitor health of this long lived native species.
		Walleye, Northern pike	Wild	General	Recreational fishery with emphasis on harvest. Monitor to evaluate source of walleye in Yellowstone River to direct management decisions for sauger conservation.
		Blue sucker	Wild	Conservation	Monitor population and investigate life history and movements throughout Yellowstone River.
		Multi species	Wild	Conservation/ General	Manage for recreational fishing opportunity where applicable. Monitor non-game fish species for native fish assemblage and overall ecosystem health.
Habitat needs and activities: Increase fish passage at Intake Diversion Dam and reduce fish entrainment into irrigation intakes. Maintain/restore river ecosystem health and function by minimizing or removing stream bank stabilization projects thereby decreasing channel confinement. Establish fish passage at Intake Diversion Dam and monitor subsequent upstream passage and habitat usage.					
Perennial Streams: Burns Rosebud O'Fallon Cedar Cabin Fox Thirteen Mile	49 miles 208 miles 157 miles 60 miles 98 miles 42 miles 50 miles	Multi species	Wild	Conservation/ General	Maintain fishery through habitat protection and restoration. Maintain or increase connectivity. Opportunistic monitor to further understand system and population dynamics.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Intermittent Streams: Armells Big Porcupine Reservation Sarpy Sunday North Sunday South Sunday Cherry Sandstone Glendive Sweeney Ephemeral Streams: 48 with documented fish populations	27 miles 107 miles 27 miles 103 miles 15 miles 68 miles 87 miles 63 miles 72 miles 53 miles 33 miles				
Habitat needs and activities: Improve fish passage at current restrictions (culverts, fords, dams) and ensure future structures provide for adequate creek flow and fish passage.					
Castle Rock Lake	153 acres	Largemouth bass, Walleye Northern pike Bluegill, Crappie	Wild/ Hatchery Wild/ Hatchery Transfer	General/ Put-Grow-Take General General	Manage as a recreational fishery, supplement population through stocking if necessary. Provide additional angling opportunity and control forage base, supplement population through stocking if necessary. Provide additional panfish angling and prey base for bass, pike, and walleye. Maintain fisheries through wild fish transfers.
Habitat needs and activities: Maintain current conditions.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
South Sandstone Reservoir	114 acres	Largemouth bass, Walleye	Wild/Hatchery	General/ Put-Grow-Take	Manage as a recreational fishery, supplement population through stocking if necessary.
		Northern pike	Wild/Hatchery	General	Provide additional angling opportunity and control forage base, supplement population through stocking if necessary.
		Yellow perch, Crappie	Transfer	General	Provide additional panfish angling and prey base for bass, pike, and walleye. Maintain fisheries through wild fish transfers.
Habitat needs and activities: Evaluate and modify overflow structure at dam to reduce escapement of adult fish into South Sandstone Creek.					
Baker Lake	96 acres	Largemouth bass	Wild/Hatchery	General/ Put-Grow-Take	Manage as a recreational fishery, supplement population through stocking if necessary.
		Northern pike	Wild/Hatchery	General	Provide additional angling opportunity and control forage base, supplement population through stocking if necessary.
		Yellow perch, Crappie	Transfer	General	Provide additional panfish angling and prey base for bass and pike. Maintain fisheries through wild transfers.
Habitat needs and activities: Water depth (less than 12 feet deep) is a common limitation that leads to frequent winterkills; limitation offset by frequent sampling and stocking or wild fish transfers.					
Spotted Eagle Pond	36 acres	All Species	Wild/Hatchery/ Transfer	Special regulations	High angler pressure and limited natural fish production mandates a reduced harvest: 5 fish daily and in possession, any combination of species.
		Largemouth bass, Walleye, Northern pike	Wild/Hatchery	Put-Grow-Take	Manage as a recreational fishery, supplement population through stocking if necessary.

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
		Channel catfish	Wild/ Transfer	General	Provide additional angling opportunity and control forage base, supplement population through wild fish transfers if necessary.
		Yellow perch, Crappie, Bluegill	Transfer	General	Provide additional panfish angling and prey base for bass, pike, and walleye. Maintain fisheries thorough wild fish transfers.
Habitat needs and activities: Poor natural fish production, growth, and recruitment because of competition with nontarget species (migrating from Tongue River), little habitat complexity, and aquatic vegetations is limited. Offset with frequent wild fish transfers and habitat projects aimed at increasing water quality and reducing nontarget fish abundance.					
Gartside Reservoir	35 acres	Tiger muskie	Hatchery	Quality	Monitor population and supplement stock if justified to control forage base. Consider restricting harvest to 1 fish over 40 inches.
		Largemouth bass, Northern pike	Wild/ Hatchery	General/ Put-Grow-Take	Maintain fishery through regulations and stocking if necessary.
		Bluegill, Yellow perch, Crappie	Transfer	General	Provide additional panfish angling and prey base for bass, pike, and walleye. Maintain fisheries through wild fish transfers.
Habitat needs and activities:					
Johnson Reservoir	21 acres	Yellow perch	Wild/ Transfer	General	Manage as a recreational fishery. Supplement population through wild fish transfers if necessary. Utilize population for transfer to other ponds.
Habitat needs and activities: Utilize yellow perch population as donor source for wild fish transfers to other ponds/reservoirs. Explore opportunities to control forage base.					
Rattlesnake Reservoir	12 acres	Crappie	Wild/ Transfer	General	Provide panfish angling opportunity, supplement population through wild fish transfers when necessary.
Habitat needs and activities: Limited water depth and severity of winter creates an annual problem of partial or total winter kill; limitation offset by aerator installation and frequent sampling and wild fish transfers.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Homestead Reservoir	12 acres	Yellow perch	Wild/ Transfer	General	Manage as a recreational fishery. Supplement population through wild fish transfers if necessary.
		Northern pike	Wild/ Hatchery	General	Provide additional angling opportunity and control forage base, supplement population through stocking if necessary.
Habitat needs and activities: Water depth (less than 12 feet deep) that occasionally leads to winterkill; limitation offset by windmill aerator, frequent sampling and stocking or wild fish transfers.					
Marshall Reservoir, Silvertip Reservoir	11 acres 10 acres	Largemouth bass	Wild/ Hatchery	General/ Put-Grow-Take	Manage as a recreational fishery, supplement population through stocking if necessary.
Habitat needs and activities: Water depth (less than 12 feet deep) is a limitation that leads to winterkill; limitation offset by windmill aerator, frequent sampling and stocking or wild fish transfers.					
Hollecker Pond	7 acres	Largemouth bass	Wild/ Hatchery	Special regulations	Manage as a recreational fishery, supplement population through stocking if necessary.
		Bluegill	Wild/ Transfer	General	Provide additional angling opportunity and control forage base, supplement population through wild fish transfer if necessary.
		Trout	Hatchery	Put-Take	Annual stocking of catchable sized trout for kids fishing day and general angler enjoyment.
Habitat needs and activities: Frequent establishment of undesirable species via irrigation water supply or from illegal introductions. Management of undesirable species may require pond rehabilitation by mechanical draining.					
Maier Pond	6 acres	Yellow perch	Wild/ Transfer	General	Provide panfish angling opportunity; maintain fisheries through wild fish transfers when necessary.
Habitat needs and activities: Water depth (less than 12 feet deep) is a limitation that leads to winterkill; limitation offset by windmill aerator, frequent sampling and stocking or wild fish transfers.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Water	Miles/acres	Species	Origin	Management Type	Management Direction
Public Trout ponds: Clarks, Oil Pump, Harms, South Fork Fort Keogh	34 acres 7 acres 5 acres 19 acres 3 acres	Trout	Hatchery	Put-Grow-Take	Annual stocking of trout for angler opportunity.
Habitat needs and activities: Water depth (less than 12 feet deep) is a limitation that leads to winterkill; limitation offset by annual stocking.					
Small Private Ponds/Reservoirs	Various	Trout	Hatchery	Put-Grow-Take	Public relations opportunity with landowners to provide local fishing opportunity for rural community. Maintain fishery through regulations and annual stocking.
		Bass, Walleye, Northern pike	Wild/ Hatchery	General	Public relations opportunity with landowners to provide local fishing opportunity for rural community. Maintain fishery through regulations and annual stocking when necessary.
		Crappie, Yellow perch, Bluegill	Wild/ Transfer	General	Public relations opportunity with landowners to provide local fishing opportunity for rural community. Provide panfish angling opportunity, supplement population through wild fish transfers when necessary.
Habitat needs and activities: Water depth (less than 12 feet deep) is a limitation that leads to winterkill; limitation offset by windmill aerator, frequent sampling and stocking or wild fish transfers.					

DRAFT STATEWIDE FISHERIES MANAGEMENT PLAN

Notes:
